The impact of collaborative CPD on classroom teaching and learning

Review: What do teacher impact data tell us about collaborative CPD?

Review conducted by the CPD Review Group

The EPPI-Centre is part of the Social Science Research Unit, Institute of Education, University of London
Authors
This report was written by a team of colleagues from the Centre for the Use of Research and Evidence in Education (CUREE), including Philippa Cordingley, Miranda Bell, Donald Evans and Antonia Firth. The Impact of CPD Review Group and Advisory Group provided valuable advice, support and critique influencing both the direction and scope of the review and in editing the draft report.

ACKNOWLEDGEMENTS

The review was coordinated by the Centre for the Use of Research and Evidence in Education (CUREE). Sponsorship was provided by the DfES, by themselves, and through the Evidence for Policy and Practice Information and Co-ordinating Centre (EPPI-Centre), and by the General Teaching Council (GTC). Additional sponsorship was received from The National Union of Teachers (NUT). As in the first and second reviews, CUREE also provided funding to complete the review.

We would like to express our gratitude to all the members of the Review and Advisory Groups who provided such valuable and informed guidance throughout the various stages of the review, and offered critical appraisals of the review draft protocol and report. We are also indebted to colleagues from Higher Education Institutions (HEIs) who kindly volunteered to help with data extraction. We would like to express our thanks to our user groups from policy and practice who contributed their knowledge to discussion of the draft report and, in many cases, provided written feedback on our draft report.

We also wish to acknowledge the guidance and training in the systematic review process given by members of the EPPI-Centre. Particular thanks are due to Zoe Garrett and James Thomas.

Finally we wish to acknowledge, in particular, the practical support provided by:

- Janet Sturgis for her extensive hands-on involvement with data extraction;
- Alison Stott for her valuable contribution to data extraction;
- Lesley Saunders for her support, feedback and encouragement;
- Chris Day for his helpful feedback particularly in relation to the final report;
- Hazel Hagger in helping to formulate the research question and hands-on participation throughout the review process; and
- all our reviewers for working through such a challenging process.

Conflict of interest statement

The review has been conducted in a consistently transparent manner, working within EPPI-Centre guidelines, methodology and quality assurance procedures. At present, there are no known potential conflicts of the interests of authors, Review Team members and Advisory Group members. Many of our academic colleagues and sponsors, such as the DfES, NUT and GTC are themselves providers of continuing professional development (CPD) so have a keen interest in the results of the review but no direct pecuniary interest likely to be affected by its conduct. CUREE is contributing actively to the development of the Government’s programme for Capacity Building for CPD in schools. The findings from the first CPD EPPI-Centre review have contributed to this programme.

SUMMARY

This summary briefly sets out the background, rationale and methods used to conduct this systematic review. The results are outlined in relation to the design, content, methodology and context of the studies involved. The summary then outlines the findings in relation to the review questions and concludes with implications for practitioners and policy-makers.

Aim
Our aim was systematically to review the literature relating to the impact of collaborative CPD that measured only teacher impact, and then to compare two distinct clusters of CPD – studies that looked for evidence relating to the impact of the CPD on teachers and pupils (reviewed in the first and second reviews by this group), and CPD that focused only on teacher impact.

Background
This review (The impact of collaborative CPD on classroom teaching and learning: what do teacher impact data tell us about collaborative CPD?) aimed to test and build upon the first (Cordingley et al, 2003a) and second (Cordingley et al, 2005) CPD reviews and in doing so to explore the methodological issues related to evaluating data related to pupils and teachers as compared with teacher only data.

In the first review we sought to identify processes involved in collaborative CPD interventions that have a positive impact on teaching and learning. In the second review we systematically reviewed and synthesized the data from studies of individually oriented CPD, before comparing individually orientated CPD with collaborative CPD. In doing this the searches for the first review were updated and the findings from the studies of collaborative CPD in the first review were applied to any additional studies of collaborative CPD identified in the second review. This enabled us to refine and build on definitions of collaboration established in the first review and to analyse, in detail, the nature and relative importance of collaboration as there has been a significant growth in both activity and research in this field since the first review. Indeed, in the UK this seems to have been partly as a result of the first review.

The aim of this third review was to identify those studies of collaborative CPD which focused on teachers across the 5-16 age range, but which only provided data about teacher outcomes, to enable us to identify the impact and specific characteristics of teacher-focused studies. In a second stage of the analysis we compare the processes and outcomes of the CPD described in them with those from the teacher and pupil focused studies that were investigated in our first and second reviews. We were interested to review studies exploring teacher impact only to see what additional light they might throw on the first two reviews, in relation to aims, CPD processes, methods and findings.

As with the earlier reviews the Review Group hope to make some of this evidence available to practitioners in an accessible and meaningful way, to highlight the areas in which further research would make a valuable contribution to CPD strategies and to enable evidence informed reflections upon implications with policy-makers.

Definitions
For consistency, we continued to use the definition of CPD we adopted for the first and second reviews:

“Professional development consists of all natural learning experiences and those conscious and planned activities which are intended to be of direct or indirect benefit to the individual, group or school and which contribute through these, to the quality of education in the classroom. It is the process by which, alone and with others, teachers review, renew and extend their commitment as change agents to the moral purposes of teaching; and by which they acquire and develop critically the knowledge, skills and emotional intelligence essential to good professional thinking, planning and practice with children, young people and colleagues through each phase of their teaching lives”. (Day 1999; p.4)

For the purposes of this review, ‘collaborative CPD’ refers to programmes where there were specific plans to encourage and enable shared learning and support between at least two teacher colleagues on a sustained basis. Sustained CPD refers to programmes that were designed to continue for at least twelve weeks. The review includes those studies of CPD which reported evidence of impact, either positive or negative, on teaching.

**Review questions**

The over-arching question for the third review is:

*What can we learn from studies of sustained, collaborative CPD which set out to explore the impact on teachers and teaching but do not also consider the impact on pupils in the context of the evidence from previously data extracted studies of collaborative CPD that consider the impact on both?*

(For brevity this is sometimes shortened to: *What do teacher impact data tell us about collaborative CPD?*)

The evidence of the impact of collaborative CPD from studies that measure both teacher and pupil outcomes is taken from the first two reviews of CPD by this group (Cordingley et al. 2003, 2005). The studies of collaborative CPD that measure only teacher impact are identified from the searches of the first two reviews and the data are synthesized in this, the third, review. Comparisons are then made between the two clusters of studies drawing on the syntheses in the three reviews.

**Sub Questions**

The first phase of the synthesis for this review (Chapter 4.2.1) synthesizes the data from studies that only measure teacher impact relating to the question:

*What is the impact of sustained, collaborative CPD on teachers and teaching?*

We then go on to look across studies of collaborative CPD from all three reviews and compare the two clusters – teacher and pupil focused studies with teacher oriented studies. The comparison is structured around the following sub-questions:

*Do the studies of the three different reviews provide evidence about different types of aims for the CPD depending on whether they explore only the impact on teachers and teaching, or explore the impact on teachers, teaching and pupils?*
Do the studies of the three different reviews provide evidence about different types of CPD processes and activities depending on whether they explore only the impact on teachers and teaching, or explore the impact on teachers, teaching and pupils?

Do the studies from the three different reviews provide evidence about different types of outcomes for the CPD depending upon whether they explore only the impact on teachers and teaching, or explore the impact on teachers, teaching and pupils?

Finally, we explore whether studies that investigate sustained collaborative CPD use different study designs depending on whether they explore only the impact on teachers and teaching, or explore the impact on teachers, teaching and pupils.

Method

Identifying, describing and appraising studies

For practical reasons, the review focused on studies published after 1991 that were reported in English, although no geographical limits were set. We wanted to engage both primary and secondary practitioners, so the review included studies that involved teachers of the 5-16 age group. The studies had to have a focus on teaching and learning and outline the explicit learning objectives of the CPD.

All the studies included in the third review were identified through the searching and screening processes of the first two reviews (Cordingley et al. 2003, 2005).

Methods of identifying studies for the systematic map and in-depth review comprised:
- a systematic search of the literature, using electronic databases, handsearching key journals, word of mouth, citations and websites
- the application of a set of initial inclusion criteria to the titles and abstracts thus uncovered
- retrieval of full reports, to which the criteria were re-applied to see if they were suitable for inclusion in the mapping stage of the review
- keywording all the included reports by EPPI core keywords, such as type of study, type of setting, age, curriculum focus, as well as a number of review specific keywords to distinguish finer detail between types of intervention, teachers and processes
- the application of a second, narrower set of inclusion criteria to the keyworded reports to identify studies that did and did not include student data
- using EPPI data-extraction software to extract data from the studies and to assess the weight of evidence they provided for answering the review specific question
- applying keywords and extracting data by two people operating independently and then reconciling their analysis
- using the evidence from the tables from the data extraction as the basis for synthesizing the studies to answer our review questions

Results

Mapping of all included studies

During our first and second reviews we sifted 18963 titles and abstracts systematically, reviewed 489 full text studies, 45 of which were identified as meeting the inclusion criteria for the current review and were included in a systematic map of the literature. The 45 studies were made up of 31 studies which contained teacher and student impact data (included in the in-depth reviews of Cordingley et al. 2003;
and 14 studies which had been excluded from the in-depth reviews of the first and second reviews because the study reported only teacher impact data and did not examine the outcomes of the CPD in relation to students.

**Characteristics of all included studies**
The majority of the 45 studies in the systematic map came from the USA. The educational settings in which the studies took place were predominately primary (N=29) and secondary (N=24) schools, while some settings covered both. The vast majority of the studies (N=42) focused on teaching and learning. The next most popular focus of all studies was curriculum (N=33), where the subject was likely to be mathematics, literacy (first language) or science.

**Weight of evidence**
Of the 45 studies in the systematic map 31 had already been reviewed in-depth in earlier reviews (Cordingley et al. 2003, 2005). Therefore the current review involved data extraction of fourteen studies that measured only teacher data. Of these 14 studies, three were judged to have low Weight of Evidence (WoE). As a consequence, the three studies were data-extracted, but were not included in the synthesis. Two of the resulting eleven studies were found to have high WOE and the rest were assessed as medium.

**FINDINGS AND IMPLICATIONS**

**Synthesis of findings**
The first stage of the synthesis brings together the findings from the 11 higher weight of evidence studies that only measured teacher outcomes. The syntheses of the studies that measured both teacher and pupil outcomes are included in the previous reviews by this group (Cordingley et al. 2003, 2005).

**Types of study**
In the majority of the studies that collected only teacher data (7/11) the research aims primarily related to the evaluation of a particular CPD design or approach in the context of a curriculum-based goal. In four cases the CPD studies were directed mainly at the improvement of a particular aspect of the curriculum or teaching strategies, using the CPD as the vehicle for improvement.

In all cases but one the researchers provided data about the interventions which offered us the opportunity to:
1. identify and report on the CPD processes and activities for this group of studies and
2. compare these across the two groups of studies: i.e. those which present teacher impact data (synthesized in the third review) and those which also present student impact data (synthesized in the first and second reviews).

**Impact of the CPD in the teacher only studies**
We have categorised all outcomes in two broad clusters: behavioural and affective.

**Impact on teacher behaviour:**
- *Teaching*: In all but one of the studies the teachers involved in the CPD interventions changed or substantially developed aspects of their teaching
following the CPD intervention. The remaining study helped embed professional collaboration among the teachers as an ongoing approach to professional practice, but reported no detailed data about the practical impact of this on teaching behaviours.

- **Ongoing collaborative working:** The studies all suggest that collaborative CPD processes are linked with a disposition to work and reflect collaboratively with colleagues as an ongoing process, whether or not this is an aim of the CPD.

**Affective impact:**
All of the studies reported both observable and self reported enhancement in at least one of the affective aspects of professional learning:
- motivation;
- confidence;
- attitudes and beliefs

**CPD processes and characteristics in the teacher data only studies**
The evidence from this group of studies reinforces the findings about the nature of effective collaborative CPD from our previous CPD reviews. Specifically the studies provided evidence about the positive benefits of CPD that:
- made use of peer support;
- made explicit use of specialist expertise;
- made explicit mention of involving the teachers in applying and refining new knowledge and skills and experimenting with ways of integrating them in their day to day practice; six studies involved action research;
- involved consultation with the teachers, about their own starting points, the focus of the CPD, the pace of the CPD or the scope of the CPD;
- involved teachers observing one another as an integral part of the CPD; and
- involved specialists in observation and reflection (as part of the CPD rather than exclusively focused on data collection).

**Nature of collaboration in the teacher data only studies**
In the second review (Cordingley et al., 2005) as well as looking at the impact and characteristics of collaborative CPD we began to explore the nature of collaboration in more detail and, in the light of the evidence from this review, advanced some tentative hypotheses about the characteristics of effective collaboration. These were:
- classroom–based activities may be a helpful factor in increasing the effectiveness of the CPD;
- collaboration between teachers which is coupled with active experimentation may be more effective in changing practice than reflection and discussion about practice alone;
- collaboration may be an effective vehicle for securing teacher commitment and ownership of CPD in cases where it is not possible for the teachers to select a CPD focus of their choice; and
- paired or small group collaboration may have a greater impact on CPD outcomes than larger groups.

We applied the hypotheses developed in the second review to the teacher data only studies synthesized in the third review. Doing so identified the following patterns:
- location: The majority of the interventions took place, wholly or to a significant extent, within the teachers’ own schools. In general this finding is consistent
with the proposition that CPD seems to be effective when it has a significant in-school component.

- experimentation versus reflection: The majority of the studies combined reflection and discussion about practice with active experimentation in classroom practice. This is consistent with the trend towards paired collaboration and with the hypothesis that active experimentation may be an effective means in changing practice.
- groupings: Teachers working in pairs was the most common form of collaboration, although it was unclear in two of the studies what the unit of collaboration was. In some of the larger studies there were opportunities for collaboration in larger groups as well.
- voluntarism: In all but two of the studies teachers were voluntary participants in the CPD intervention. However it seems the affective impact of collaborative CPD together with the acquisition of new knowledge and understanding engendered a sense of ownership among teachers in all cases.
- student orientation: While we did not explicitly aim, or expect, to find details about student outcomes in this third review we did expect that teacher perceptions about the impact of the CPD on their students would feature within the teacher data. As this kind of teacher perception data was only sparsely reported this did not prove to be the case.

In relation to the nature of collaboration this review adds to our understanding of the nature of effective collaboration to the point where we feel more confident about our four propositions from our second review. In exploring the components of CPD that are linked to positive outcomes we are noting strong patterns of connection rather than causation. Without further research in which the components are treated as independent variables causation cannot be established.

How did the teacher studies compare with those reporting pupil data?
In the second phase of the analysis we compared the nature of the higher weight of evidence studies reporting teacher only data (N=11 synthesised in the third review) with those providing evidence about impact on students (N=15 synthesised in the first review; N=11 synthesised in the second review). Specifically we explored the four areas:
- aims;
- nature of the interventions;
- outcomes;
- study design.

Whilst reviewing the studies in--depth we noticed potentially interesting and useful patterns in the literature base of the studies. This was not written into our protocol but as we feel that it sheds light on the study aims we have included the comparison.

- Literature base: There appear to be two broad fields of research here; one group focused on changes in the teaching and learning generally treats CPD as one of several interesting variables while the other group generally functions more as a set of evaluations of CPD in terms of teacher change. In this latter set the teaching and learning processes feature much less prominently than the CPD processes. The CPD programmes where pupil and teacher data were collected paid more attention to pre-existing evidence about teaching and learning than those where teacher only data were collected. Since we do not know, in the teacher data only studies, what the impact on pupils was, the lack of attention to the pedagogic research base
may or may not be an important aspect of the study. It may be that the teacher only studies did refer to pedagogic literature but didn’t have room to report it in the article. But since they give considerable space to reporting the CPD literature this seems unlikely.

- **Aim:** Teacher only and teacher and pupil studies gave equal attention in their aims to exploring the impact of a specific teacher development programme or to assess the impact on teaching and learning of introducing specific pedagogic strategies (half of each group in each case). Studies which focused on teacher impact only were more likely to have an explicit intention to develop teachers’ knowledge, understanding or skills and were much more likely to have an explicit aim to change teacher beliefs or attitudes. Studies which provided pupil and teacher data were inevitably more focused on improving pupil outcomes and, perhaps as a result, on enhancing teacher practice.

- **Nature of the interventions:** The key strategies used in the two groups of studies were similar in relation to:
  - the use of specialist expertise;
  - creating opportunities for teachers to observe others teach;
  - peer support; and
  - the use of workshops and seminars.

All these strategies feature prominently in both clusters of studies, but there was a greater explicit emphasis on processes described as action research in teacher only studies. In both groups of studies, however, programmes that made explicit reference to action research were very similar in content to those that described themselves as coaching programmes.

- **Outcomes:** All the teacher only data studies focused upon affective outcomes compared with fewer than half of the studies reporting student impact data. Changes in teacher behaviour was an explicit outcome of the vast majority of studies with similar proportions in each cluster providing evidence for this.

- **Study design:** All the studies were evaluations. The majority of studies in both the teacher and the teacher and pupil clusters were researcher manipulated evaluations. The rest were naturally occurring evaluations. Control or comparison groups featured much more strongly in the teacher and pupil impact studies than they did among the teacher impact studies. Teacher only studies were much more likely to collect data during the study than were those reporting student outcomes. Studies designed to explore the impact of CPD on teachers only were generally longer than those studies which collected pupil data

**Nature of the studies**

We had wondered whether the teacher only data studies would provide evidence about teacher perceptions of impact upon students. In fact very few data about teacher judgment of impact upon students were recorded. The implication seems to be that CPD explored by studies that focus on teacher only data is aimed more explicitly at changes such as teacher knowledge, beliefs and understanding which cannot be directly observed. It could be that teacher only studies set out to provide evidence about these phenomena as a proxy for direct pupil data. By contrast the studies which provide data on changes in pupil learning may feel this is sufficient evidence to imply changes in teacher attitude. Consequently the teacher and pupil studies focused much less on affective outcomes.

Two broad areas of research emerged from the studies: there was either a focus on changing teaching and learning generally, in which CPD was treated as an incidental
variable; or the studies set out to evaluate CPD and placed less emphasis on teaching and learning.

Furthermore, the CPD programmes where pupil and teacher data were collected built more directly than the teacher only studies on pre-existing evidence about teaching and learning. The CPD programmes in the teacher only studies, on the other hand, focused more than the comparison group on pre-existing evidence about CPD. The teacher only studies were, in effect, evaluations of CPD whilst the other group of studies were explorations of effective ways of achieving change and improvement in teaching and learning.

There was a certain lack of potentially useful detail in both groups of studies: the teacher and pupil data studies provide little information on the nature of intervention and underpinning rationale; whereas the teacher only studies are lacking in evidence on teaching and learning.

**Strengths and limitations of this systematic review**

**Strengths**

One strength of this review is the way it builds systematically and cumulatively on previous reviews. In doing so it has continued to probe the questions raised in previous reviews about the emphasis on impact and the exclusion of other types of evidence. Another strength is the way that the review grows from live concerns and consultation with policy-makers and practitioners through the involvement of a number of user groups in setting and refining the questions, and interpreting and disseminating the findings.

In particular the CPD Review Group considers that the review has continued to help in the following ways:

- developing a taxonomy of collaboration which is meaningful and applicable to practitioners and policy makers;
- adding to the base from which we can continue to unpack the specific processes involved in the CPD intervention and identify those which appear to influence change in teacher practice;
- exploring further the effect and influence which external and specialist expertise brings to design and impact of CPD processes; and
- identifying the patterns of research related to CPD and the relative strengths and weaknesses of studies that do and do not collect pupil outcomes data.

**Limitations**

- One limitation of the review was that we didn’t run any additional searches to see whether there were any other articles or reports covering student data for these programmes by the authors of the teacher only studies, although the descriptions of methods and approaches within the articles suggest this is unlikely to be the case.
- We were conscious throughout of the limitations of the data provided in the studies we retrieved in regard to answering our review question. None of the studies was designed to answer our review question directly.
- In particular, we noted problems arising from the compressed timetable for completing the review. There were difficulties in responding to possible trends or patterns arising out of answers to the questions in our protocol by creating further tables. We were unable to go back to the original studies from the earlier reviews in the detail that we would have liked to follow up new points arising from the
current review. For example we would have preferred to carry out a more detailed analysis of the outcomes for teachers.

- We also noted in the individual studies:
  - a varying amount of detail about the sample in some of the studies, and some reviewers noted that they would have liked to have been given more detail about the sample background(s) in order to make the connections between contexts;
  - a lack of detail, and in some cases, clarity, of the different aims and foci of the studies;
  - the overwhelming majority of studies were conducted in the USA and so it is not known whether the findings could also apply in other countries;
  - there may well have been additional fruitful data in a number of PhDs and other studies. However, we were unable to retrieve these within our timescale and note that these data remain unexplored;
  - a lack of discussion, in some studies, of the effect of using the researchers as part of the CPD intervention on the evidence; and
  - the small-scale nature of some of the studies included in the in-depth analysis.

Implications

Implications for Practitioners

The research suggests that collaborative CPD is linked with positive outcomes regarding teachers’ attitudes to working and reflecting collaboratively with colleagues on a sustained basis.

Schools and CPD co-ordinators working with colleagues who have little or no inclination to work with others should create and resource opportunities for teachers to participate in CPD in partnership with one or more colleagues.

In cases where teachers did not volunteer to take part in the CPD but were required to do so, the collaboration designed into the intervention helped to convert initial co-operation into genuine collaboration.

Schools and CPD leaders should pay attention to the potential benefits of collaboration when trying to meet the needs of disaffected or demotivated colleagues. Similarly, CPD co-ordinators should ensure that they use collaboration (eg in refining learning goals) as an important tool for teachers facing mandatory programmes – to develop ownership and personalise their learning.

Most of the effective CPD in the research included learning which took place in the teachers’ own schools and classrooms.

CPD leaders and teachers need to harness all available in-school opportunities for professional learning: for example through team teaching, and ensuring that lesson-planning takes place collaboratively and is structured to include opportunities for debriefing.

The positive outcomes reported in the studies in the review were linked to CPD interventions which combined reflection with active experimentation.

CPD leaders and head teachers should review CPD plans and opportunities to ensure that opportunities for professional dialogue are linked to opportunities to experiment with new approaches in order to root learning conversations in classroom evidence. Teachers should seek out such opportunities.

Collaborative CPD can be effective in more intimate settings.
School and CPD leaders and CPD providers might want to consider offering teachers opportunities for small group or paired work within any larger groupings. There was little evidence about teachers’ perceptions of the impact of the CPD on their pupils’ learning in the studies which focused only on impact on the teachers. But studies from previous reviews that do contain pupil impact data highlight the way in which pupil impact motivates teachers to sustain their learning. 

CPD leaders and programme managers should encourage teachers to articulate, record and reflect upon their perceptions about the impact of the CPD and related changes in classroom practice on their students’ learning.

The group of studies which focused solely on collecting teacher impact data were sustained over much longer periods than those which also collected student data. Yet an earlier review found that gains for the CPD were not necessarily greater for those lasting more than one term. CPD leaders and heads should reflect regularly on the match between the distance to be traveled and the length of any CPD interventions whilst bearing in mind the benefits associated with CPD that lasts at least one term.

The CPD processes linked with positive outcomes for teachers in the studies with teacher only data are consistent with those that show positive impact for pupils. This may suggest that these characteristics of CPD, in combination, could be used by school and CPD leaders, on an experimental basis, as proxy success indicators in weighing up whether to pursue certain CPD opportunities. Policy makers should encourage schools and CPD providers to consider the highlighted characteristics of CPD as a set of questions to be applied to CPD proposals and activities in order to probe the likelihood of positive outcomes for students and teachers. Such approaches will be experimental and their usability and utility should be monitored.

The review found that studies which focused their aims on both teacher and student outcomes were more likely to have rooted their interventions in evidence about pedagogy. Conversely, studies which focused their aims on teacher impact were more likely to have been rooted in the literature about CPD and adult learning. CPD providers and CPD school leaders should ensure that CPD programmes draw explicitly on both the relevant public knowledge bases about teaching and learning and about CPD.

Implications for Researchers
The aims of the studies in the groups differed markedly. In the group of studies which collected data on both pupils and teachers (N=26) only three specifically targeted affective outcomes from their interventions. In the other group of studies which collected data only on teacher impact, most (seven out of eleven) targeted such outcomes. Yet affective outcomes featured as incidental findings in many of the first group of studies. Researchers exploring the impact of CPD on teaching and learning should consider collecting systematic evidence about the impact of CPD on affective aspects of teachers’ professional identity.

Studies of CPD which was linked to positive outcomes identified core elements of collaboration which recurred in combination. The specific effects of the individual components in isolation from each other were not explored. Researchers exploring the impact of CPD should consider collecting data about the relative impact of these core elements, by treating the components as independent variables.
Studies which focused on teacher data were less comparative in their designs than studies which collected both teacher and student data. While recognising that the control and comparison groups in the first group of studies comprised of students rather than teachers, we nevertheless believe that studies which focus on teachers need to place greater emphasis on collecting comparative data.

The group of studies which focused solely on collecting teacher impact data were sustained over much longer periods than those which also collected student data. Future reviews should explore whether this difference is accounted for by the much greater emphasis on affective goals, or by the need for a short term focus in order to enable collection of data about outcomes for particular cohorts of students.

The review found that the CPD featured in studies which focused their aims on both teacher and student outcomes was more likely to be rooted in evidence about pedagogy. Conversely, the CPD in studies which collected only teacher impact data was more likely to be rooted in the literature about CPD and adult learning. In future, studies of CPD and the related interventions should incorporate and build equally upon the pedagogic and the CPD literature. In other words, studies that evaluate specific CPD programmes need to problematise the nature of the changes in pedagogic practice as well as the CPD processes. Similarly studies of the development of teaching and learning need to problematise the CPD processes and interventions and to collect and analyse data about them if they are to provide research users with the information they need to operationalise findings and recommendations.

Implications for Policymakers
CPD is the vehicle through which all new policies must work if change is to become embedded rather than cosmetic. The cumulative picture of positive outcomes for teachers and pupils emerging from this review suggests that collaborative CPD between teachers has the potential to play a critical role in interpreting and embedding all policy initiatives in practice. The complex combinations of sustained peer and specialist support, of in-class experimentation coupled with protected space for reflection and structured dialogue and the role of collaboration in personalising goals, sustaining commitment and developing ownership are challenging. They sit at some distance from traditional conceptions of CPD and the current arrangements for organising and evaluating it in many schools. But they reinforce the emerging consensus about the nature of a proactive, modern profession within which teachers are seen as an important resource for each other in supporting and sustaining the development of their own and their colleagues’ practice. Policy makers should review both explicit and implicit assumptions about the ways in which new initiatives are implemented in schools and consider how these could be enhanced by an explicit commitment to sustained, collaborative CPD.
1. BACKGROUND

1.1 Aims and rationale for the review

This is the third review of the impact of CPD on classroom teaching and learning conducted by the CPD Review Group. In the first review we sought to identify processes involved in collaborative and sustained CPD interventions that have a positive impact on teaching and learning. In the second review we identified and synthesised data from studies that investigated individually oriented CPD, before comparing individually orientated CPD with collaborative CPD. In doing this we also updated the searches from the first review and applied the results of any additional studies to the findings of the first review. This enabled us to begin to develop a detailed understanding of the nature of effective collaboration. We were interested in analysing, in detail, the nature and relative importance of collaboration as there has been a significant growth in both activity and research in this field since the first review. Indeed, in the UK this seems to have been partly as a result of the first review. The enterprise of researching a phenomenon as complex as CPD that encompasses multiple intervening variables seems to have continued to pose a considerable challenge to research teams; particularly those determined to explore impact on both teachers and pupils. Perhaps as a result the majority of studies identified in both the first and second reviews compared CPD with no CPD although a few compared different CPD inputs.

CPD is a very broad concept. Our determination to try to be comprehensive led us to use a wide range of search terms. As a result we have had to set aside a large number of studies. In the first review we looked at 13479 titles and abstracts and 266 full studies and for the second review we looked at 5505 titles and abstracts and 223 full studies – to focus in each case on 17 different studies for data extraction. In doing this we became aware that a significant number of studies whose research questions and methods related closely to our own questions and criteria were being set aside for one reason only; they explored the impact of the CPD only in relation to its impact upon teachers.

We were interested to review these studies to see what additional light they might throw on the first two reviews. In particular we wondered whether the studies with teacher only data would:

- use the capacity freed by not focusing on pupils to explore other aspects of CPD in more depth. For example, would these studies provide more data about the CPD processes, the teachers involved in the CPD, their school contexts or the leadership of the CPD?
- result in similar or different findings about effectiveness for similar CPD processes
- adopt different methodological approaches, aims or definitions.

Hence the purpose of this third review was to extend the findings of the first two reviews (Cordingley et al, 2003a and Cordingley et al, 2005) by synthesising data from studies which focused on the impact on teachers but not on students and to discover whether a focus on teacher only data enabled research teams to provide a more detailed picture of outcomes, CPD processes and evaluation processes and in doing so to explore the methodological issues related to evaluating data about pupils and teachers as compared with teacher only data. Appendix 1.2 highlights the relationship between the three reviews.
1.2 Definitional and conceptual issues

**Continuing Professional Development (CPD)**

For consistency, we continued to use the definition of CPD we adopted for the first and second reviews.

“Professional development consists of all natural learning experiences and those conscious and planned activities which are intended to be of direct or indirect benefit to the individual, group or school and which contribute through these, to the quality of education in the classroom. It is the process by which, alone and with others, teachers review, renew and extend their commitment as change agents to the moral purposes of teaching; and by which they acquire and develop critically the knowledge, skills and emotional intelligence essential to good professional thinking, planning and practice with children, young people and colleagues through each phase of their teaching lives”. (Day 1999; p.4)

In this review, we have synthesised data from studies which reported on teacher impact data only and have compared the data with the findings related to both teacher and student outcomes identified in the first two reviews. All the studies reviewed synthesised in the third review were identified in the searching processes for the first two reviews and so were judged to have met our inclusion criteria with the single exception that the studies in this review report only teacher impact data and do not go on to examine the outcomes of the CPD in relation to students.

**Sustained CPD**

All the included studies in the review were designed to span at least twelve weeks. This was because none of the studies which met all the criteria for inclusion in the first review was of shorter duration than a term. From this point on when we refer to CPD in this report we mean that the CPD is sustained, for reasons of brevity.

**Collaborative CPD**

In the review we included studies in which CPD interventions were designed to be collaborative – that is, where there were specific plans to encourage and enable shared learning and support between at least two teacher colleagues on a sustained basis. In all three reviews we deliberately excluded one-off, one-day or short residential courses with no planned classroom activities as a follow up and/or no plans for building systematically upon existing practice. As with the earlier reviews the Review Group hope to make some of this evidence available to practitioners in an accessible and meaningful way, to highlight the areas in which further research would make a valuable contribution to CPD strategies and to enable evidence informed reflections upon implications with policy-makers.

We also noted in our first two reviews that whilst teachers mostly volunteered to participate and were thus collaborating voluntarily, this was not always the case. In one of the largest studies in the second review, for example, the teachers had no choice about taking part in the development work. However, the extensive work on trust building and creating opportunities for teachers to build on their own needs and starting points demonstrated by this study reassured us that the CPD could accurately be described as collaborative rather than as enforced or guided co-operation. Like the others, this review has not excluded programmes where teachers
were not volunteers but aimed to carefully monitor the boundaries between co-operation and collaboration.

**CPD Interventions**

At the outset of the review we did not go into any more detail than the above descriptions about what processes and interventions constituted collaborative CPD. During the sourcing and classification stages of the earlier reviews, it became clear that there was a range of collaborative types of CPD which showed a lot of similar characteristics, even though they were labeled differently or pursued different goals. In a number of cases a range of strategies including cross-moderation and contact with the authors were used to ensure that studies were correctly defined as studies of collaborative CPD.

**Conceptual and theoretical issues**

Whilst empirical studies in complex fields such as education inevitably select a specific focus in order to make research feasible, theory about CPD can and does address the issue holistically, taking due account of its complexity (Doyle, 1979; Fullan, 1991; Guskey and Huberman, 1995; Hargreaves, 1993). Such theoretical and scholarly work draws on a rather more restricted empirical evidence base than is the case for, say, student learning. However this literature has continued to inform this review. It includes, for example, Huberman’s idea of ‘sustained interactivity’, Hargreave’s (in Elliot (ed)1993) views of the stages of teacher development and Fullan’s notion of the importance of ‘personal development in a social context’ for teacher development. In view of the fact that few studies of CPD carry out significant evaluation of its impact we have also found Guskey’s concept of five levels for evaluating CPD helpful.

Askew et al’s (1997) development of Shulman’s (1986) typology of teacher knowledge helped us to explore connections between CPD and teachers’ subject knowledge, their pedagogic knowledge and skills and their pedagogic content knowledge, and students’ responses to changes in teaching and learning activities. Similarly our analysis of the CPD activities was informed by the earlier work on CPD outcomes of Harland and Kinder (1997) and other typologies such as those put forward by Joyce and Showers (1988) and Day (1999). Similarly, Desforges’ (1995) reflections on the tendency of classrooms to return to the status quo – and hence the difficulties of effecting lasting change – were influential in identifying the likelihood of sustained CPD being effective.

The studies in the first two reviews had to meet objective criteria in terms of the evidence they presented about the impact of CPD on students. In the third review there was no such requirement. Hence one of the concerns in the present review was to look for indicators of how far teacher data could be used as a proxy for student data in evaluating the effectiveness of CPD interventions. If teachers reported changes in student attendance/test results/quality of written work, etc as a result of changes in their own behaviours or attitudes derived from the CPD intervention, how reliable would it be? Given that teachers are the single most important contributor to student learning, is it justifiable to study impact on teachers alone? (see for example, Tabberer, 2004, on teachers making a difference)

**1.3 Policy and practice background**

Teachers’ CPD continues to be regarded by the UK Government as a national priority for England. Since the second review was undertaken, the UK Government’s strategy for England has resulted in the Teacher Training Agency taking over
responsibility for national CPD strategy. The Government priorities for education have been set out in the 5 year strategy, in which CPD features as one of the key strands. Some of the specific issues related to CPD in this plan, such as the emphasis on coaching, are directly related to the findings of the reviews carried out by this review group. National efforts to develop support frameworks and materials for CPD leaders (for example the Key Stage 3 and Primary National Strategies) make explicit reference to evidence from the first review.

There are also a number of different operational initiatives with an emphasis upon the importance of collaboration and networking in teacher development. Examples include: the Networked Learning Communities (NLCs), Leading Edge Partnerships, Design Collaboratives, the Primary Entitlement to Collaboration, Federations, Primary Networks and the Leadership Improvement Grant Initiative. Each of these initiatives recognises the importance of collaboration without specifying the forms it might take.

Teachers’ CPD also continues to be regarded as a national priority by other key agencies, such as the General Teaching Council (GTC), the National College for School Leadership (NCSL), and professional associations such as the National Union of Teachers (NUT). There is a keen interest in the question amongst policy makers and practitioner communities. In addition, the GTC has, for some time, been encouraging experimental and incremental strategic development of approaches to CPD. It has developed the “Teachers’ Professional Learning Framework” and created a Teachers’ Learning Academy to support progression and accreditation and published occasional papers on peer dissemination and learner conversations all of which draw explicitly on the work from the first and second review.

1.4 Research background

In our reviews we drew on a large body of literature to help us refine our question to a focus on sustained CPD. It also enabled us to conceptualise more clearly the forms of CPD with the potential to sustain teacher change. This included:

- literature related to research and evidence informed practice (Cordingley and Bell, 2002);
- evidence about the importance of teacher experimentation, feedback and coaching (Joyce and Showers, 1988; 2002);
- evidence from the implementation in the UK of large scale initiatives such as CASE (Adey and Shayer 1994) and CAME (Shayer et al, 1999) and the national literacy and numeracy strategies about the effectiveness of coaching activities such as modelling and professional dialogue;
- the stages of teacher development (Hargreaves, 1993; Rich 1993); and
- the extensive literature about teacher enquiry and its benefits for teacher learning (Elliott, 1991; Stenhouse, 1980).

The literature also helped us to see the limitations of the studies in the review. For example, Day’s (1999) analysis of teachers’ personal and organisational environments and their career cycles illustrates that CPD is a highly context-specific endeavour. For this review we have, therefore, also explored the literature about the transfer of good practice (Fielding et al, 2004) and about support for professional learning by school leaders (Cordingley et al, 2003b; NCSL, 2004). The literature on systematic reviews has been useful for developing our understanding of the complexity of evaluating second-order activity such as CPD (or even third order if the impact is measured through student outcomes.)
Reflecting upon the literature reinforced our view that CPD literature derived from theoretical scholarship and review still far outnumbers empirical studies and that evidence about professional learning communities (e.g. Wallace et al, forthcoming) is much needed. In the meantime, it was difficult to relate the theory to evidence about impact relating to CPD and teachers' learning other than at a very broad and general level.

For example, whilst the work of researchers who explore teacher biographies may have helped us explore the affective aspects of teachers' personal contexts, we found no studies from this field that provided evidence about the impact of collaborative and sustained CPD in this review. Similarly, whilst the work of activity theorists, such as Engestrom et al (1999), and the growing literature about professional learning communities helped us to understand the relationship between teacher development and dynamic and complex community forces within schools, we found no core studies that addressed such issues directly. Clearly much of this is linked with the time and resource constraints which operate in the real world of funded research.

Recently there has been an increasing amount of activity in the UK in relation to the Government’s national CPD strategy. One development of this has been a growth of interest in the evaluation of CPD strategies. For example the GTC has launched a large-scale evaluation of CPD related activities with the aims of:

- identifying the professional development needs of teachers and advising on specific and overall policy challenges and changes;
- identifying the professional development needs of particular groups of teachers (early career teachers, more experienced teachers, subject specialists, etc.);
- developing and securing support for a generic framework of experiences and approaches to CPD (the Teachers’ Professional Learning Framework) and promoting its application in practice and policy;
- gathering and analysing evidence from ground-level demonstration work and from practice in order to influence national, local and school-level policy and strategy;
- piloting a national system of professional recognition of teacher learning (the Teacher Learning Academy) which both acknowledges and stimulates teachers’ participation and the quality of their learning; and
- offering a conduit (the Connect CPD coordinators network) for those in schools with responsibility for CPD to contribute to and draw from the GTC’s intelligence and knowledge base, especially on effective CPD and its ‘pedagogies’.

1.5 Authors, funders, and other users of the review

The first review was funded principally by the NUT and grew from the NUT’s concern that its CPD provision for teachers should be rooted in and developed in the context of evidence about effectiveness. The breadth of the question identified as appropriate by the review group and the group of 30 plus teachers who were consulted at the start made the first review particularly challenging and thus resource intensive. Additional financial support from the DfES via the EPPI-Centre, the GTC
and CUREE was therefore very helpful. The utility of the first review to policy makers led the Department for Education to provide resources for the second review both through the EPPI-Centre and from the CPD budget. Other financial support has come from CUREE and from in-kind support and advice from NUT.

The focus of the third review with its emphasis on comparing the outcomes and processes of studies that do and do not incorporate pupil data have the potential to inform:

- ways of evaluating CPD and the extent to which teacher judgment stands as an adequate proxy for pupil data;
- approaches to evaluate the impact of CPD; and
- the methodological issues raised by the different approaches to evaluating the impact of CPD.

In this context, in accordance with its CPD policies and strategy the GTC has sponsored the third review. Sponsorship and valuable practical support for this review was also provided by the Department of Education and Skills (DfES) through the Evidence for Policy and Practice Information and Co-ordinating Centre (EPPI-Centre). The National Union of Teachers (NUT) supported the review through providing hospitality for meetings and in-kind support and advice. A team of colleagues from Higher Education Institutions (HEIs) volunteered to help with keywording and data extraction. All members of the Advisory Group made an active contribution to the review.

The publication of the first review has encouraged a number of HEI-based CPD providers to volunteer to participate in this review as a means of developing their personal knowledge of the field and associated research literature. In addition many of the members of the first Review Group have maintained or increased their interest in, and commitment to, the work.

The core team for the third review comprised:
- CUREE colleagues including qualified teachers, researchers and information scientists;
- a research officer from the Networked Learning Communities programme;
- retired and ex-teachers;
- CPD academics from HEIs; and
- members of the Review and Advisory Groups.

Additional information regarding the users can be found in 2.1, members of the Review and Advisory Groups can be found in Appendix 1.1.

1.6 Review questions

The over-arching question for the third review is:

What can we learn from studies of sustained, collaborative CPD which set out to explore the impact on teachers and teaching but do not also consider the impact on pupils in the context of the evidence from previously data extracted studies of collaborative CPD that consider the impact on both?

(For brevity this is sometimes shortened to: What do teacher impact data tell us about collaborative CPD?) This question in relation to impact on teachers and pupils was answered in our first and second reviews.
The first phase of the synthesis for this review (Chapter 4.2.1) synthesizes the data relating to the question:

**What is the impact of sustained, collaborative CPD on teachers and teaching?**

In this part of the synthesis we are only looking at those studies which reported teacher only impact data.

**Sub Questions**

We then go on to look across studies of collaborative CPD from all three reviews and compare the two clusters – teacher and pupil focused studies with teacher oriented studies. This comparison relates specifically to findings about the outcomes, purposes, processes and activities of the CPD interventions and the studies that explore them.

We ask the questions:

*Do the studies of the three different reviews provide evidence about different types of aims for the CPD depending on whether they explore only the impact on teachers and teaching, or explore the impact on teachers, teaching and pupils?*

*Do the studies of the three different reviews provide evidence about different types of CPD processes and activities depending on whether they explore only the impact on teachers and teaching, or explore the impact on teachers, teaching and pupils?*

*Do the studies from the three different reviews provide evidence about different types of outcomes for the CPD depending upon whether they explore only the impact on teachers and teaching, or explore the impact on teachers, teaching and pupils?*

Finally, we explore whether studies that investigate sustained collaborative CPD use different study designs depending on whether they explore only the impact on teachers and teaching, or explore the impact on teachers, teaching and pupils.
METHODS USED IN THE REVIEW

This chapter describes the methods used in completing the review. Initially it outlines the question, and describes the approach and methods of involving users, before considering the detail of each of the steps of the review process.

The aim of the review was to identify those studies which focused on teachers across the 5-16 age range and provided data about teacher outcomes only to enable us identify the specific characteristics of teacher-focused studies and also to compare the processes and outcomes of the CPD described in them with those from the teacher and pupil focused studies. In our first and second reviews we examined the impact on teachers and pupils. This review is therefore linked to the outcomes of two previous systematic reviews of the literature. However, the current review used studies which had failed the criterion requiring student impact data in the first and second reviews.

Because these studies were identified during the course of the search process for the first two reviews, the inclusion criteria established for these reviews defined the limits for the third review concerning the language, location and timeframe for the studies. The criteria aimed to include only those studies most likely to provide evidence which would help to answer the review question and we present them here as they were applied in the first review. The criteria were modified for the second review to include studies of individually oriented CPD and refined slightly in a number of other ways. Both Stage 1 and Stage 2 inclusion criteria for both the earlier CPD reviews can be found in Appendix 2.1.

2.1 User involvement

2.1.1 Approach and rationale

In this report the term 'users' is defined as groups for whom the review findings are of potential interest and/or use. This included teachers, policy-makers directly concerned in planning CPD resource allocation and strategies, headteachers, CPD coordinators and other 'practitioners' who were concerned with identifying effective CPD in relation to desired outcomes. This also included academics, governors, local authorities and providers of CPD.

We adopted a number of methods to encourage a wide and inclusive base of user involvement facilitated by the National Teacher Research Panel (NTRP) and the NUT, DfES and GTC networks. Some of the users had contributed to the previous two reviews by keywording and data extraction. We also enrolled a new member from the National College of School Leadership (NCSL). We had more active participation in the third review from the academic community, perhaps because of the considerable interest in the findings from the first and second reviews and increasing interest in the process of systematic reviewing generally.

2.1.2 Methods used

Policy-makers, academics, teachers, ITT practitioners and providers were all represented on the Review Group and contributed to selecting the topic for the research focus, deciding and refining the review question and in developing the
Some members of the Review Group and a small number of HEI colleagues also helped with data extraction.

In the first review, the focus on sustained and collaborative CPD was strongly influenced by teacher input and teacher feedback and discussions involving meetings and consultations with members of the Advisory and Review Groups, consultation with teachers and informal contact with specialists in the field of CPD. The strong orientation towards user perspectives was maintained throughout the second and current (third) review but through a range of more indirect methods. Our experience of involving some practitioners directly in data extraction in EPPI reviewing was not felt to have been an appropriate use of practitioners’ time. CUREE regularly consults users regarding research priorities and CPD via focus groups and this flow of information shaped thinking at every stage. In addition Review Group members who were teachers, or worked closely with teachers, and CUREE colleagues who had recently been teachers – in some cases until very recently - were involved in a number of ways. They provided a user perspective in the development of the protocol, and – with help from an ex-teacher from NCSL – played a major role in data extraction. Professional colleagues on the Review Group were instrumental in steering the review. In addition, experienced ex-teachers working for CUREE were key participants in drafting the final report.

We offered training in EPPI-Centre methods via day-long training sessions and workshops on data-extraction as refresher courses for those members of the Review and Advisory Groups who wanted them, and as introduction courses for new members of the Groups and other interested users. These proved to be productive sessions and the opportunities were generally taken up by HEI user group colleagues whose support was invaluable throughout the review process.

2.2 Identifying and describing studies

2.2.1 Defining relevant studies: inclusion/exclusion criteria

For this review, the studies for inclusion were selected from those excluded from the first and second in-depth reviews because they did not explore or report pupil outcomes.

The very few studies of individual CPD that were included in the data extraction and synthesis for the second review were excluded because we wanted to hold all variables constant except pupil outcomes. The protocol defined collaborative CPD as teachers working together. We did not specify a typology of collaboration, nor what processes and interventions constituted definition as collaborative CPD. We defined sustained CPD as lasting at least twelve weeks or at least one term. As such, one-off, one-day or short residential courses with no planned classroom activities as follow-up and/or no plans for building systematically upon current practice, were excluded.

The first and second reviews (and hence the third review which explored studies uncovered as a result of the search process for the first two reviews) limited the search chronologically to capture studies that had been published or reported after 1988 (first review) and after 1991 (for the second review), which would include those studies conducted after the introduction of the National Curriculum (NC) in England which led to the development of teacher CPD and research into NC areas.
The reviews confined themselves, for practical reasons and because we wanted to engage the interest of both primary and secondary practitioners, to teachers of the 5-16 age group. While this excluded FE and Sixth Form college practitioners, it did not exclude those who teach within the 11-18 age range.

The reviews only included studies written in English because of translation costs but did not limit the search geographically. We correctly expected to retrieve most of our studies from outside the UK, specifically from the USA.

Studies included in the systematic map for the third review had to meet the following criteria:
1. focus on CPD that provides explicit information about whether the CPD was designed to facilitate collaboration to support individual teachers;
2. focus on CPD which is designed to meet explicit, learning objectives;
3. focus on CPD designed to sustain learning for 12 weeks, or one term or more,
4. have set out to measure impact on teachers and teaching;
5. describe the methods of data collection and analysis and the target population;
6. attempt to establish the reliability and validity of data analysis
7. report on the aims and objectives of the research;
8. focus on teachers of the 5-16 age;
9. be written in English;
10. show how they have used what is known already (e.g. by including a literature review); and
11. have been published after 1991

Appendix 2.1 contains the full list of criteria from both the first and second reviews. The criteria in the second review were broadly similar to those in the first review for purposes of consistency. However, they were refined and re-prioritised as a result of lessons learned from the first review. For example, some of the criteria were moved to the Stage 1 inclusion criteria in order to save time and resources by filtering studies out/in earlier. This initial set of criteria was applied to the titles and abstracts uncovered in the search.

2.2.2 Identification of potential studies: search strategy

The third review used teacher only data studies which had already been identified and so the search strategy was that described in the first and second reviews.

The studies were identified from the first two reviews as follows:

- searching electronic databases (including Educational Resources Information Centre (ERIC), the British Education Index (BEI), Current Educational Research in the UK (CERUK), Education-Online, OCLC FirstSearch and INGENTA). We retrieved some theses from our overall search strategy, and attempted to track down other theses and related journal articles by identifying potential authors and contacting them directly;
- hand searching key journals as recommended by Review and Advisory Group members as being relevant to CPD;
- trawling websites (including the American Educational Research Association (AERA) and the Association for the Advancement of Educational Research (AAER) websites. Other websites included the Australian Council for Educational Research (ACER), the Scottish Research in Education Centre (SCRE), the National Foundation for Educational Research (NFER), the Office for Standards
in Education (OFSTED), DfES, British Educational Research Association (BERA),
and selected LEA and University websites;
• following up recommendations from Review and Advisory Group members and
knowledgeable researchers in the field, as well as approaching numerous
overseas researchers for advice; and
• following up citations in published and unpublished research.

More details on the search strategies employed in the first and second reviews are
presented in Appendices 2.2 and 2.3

2.2.3 Screening studies: applying inclusion/exclusion criteria

The studies in the third review had already been screened and had the systematic
map (stage 1) and in-depth (stage 2) inclusion and exclusion criteria from the first
and second reviews applied to them. For this process in both reviews, our inclusion
and exclusion criteria allowed us to screen the studies for relevance to our review
questions. All citations (titles and abstracts) identified in initial searches were
subjected to the application of Stage 1 inclusion criteria. This stage was carried out
on-screen (with the exception of the journals which were hand-searched). In order to
be included in the next stage of the review, by which we mean the retrieval of the full-
text document, studies had to meet all the Stage 1 criteria. We excluded reports
which did not meet any one of the Stage 1 inclusion criteria. As only a limited
amount of information was presented in the title and abstract, to minimise the risk of
relevant studies being excluded at this stage, we erred on the side of caution and
adopted a policy of inclusion where there was any doubt. Once the full-text
document was retrieved, which wasn’t possible in all cases, the Stage 1 inclusion
criteria were re-applied to the full reports.

The citation details for all the full reports which we retrieved were entered into a
reference management tool – Biblioscape. Where a full report did not meet all the
inclusion criteria for Stage 1, reviewers recorded at least one of the exclusion criteria.
This recording was not in any specified order or hierarchy within the Stage 1 criteria,
and so we coded and entered the first criterion which they did not meet. We then
proceeded to keyword all the reports which fulfilled our Stage 1 criteria.

As additional screening for the third review we revisited the studies and cross-
moderated them to confirm their inclusion in the in-depth review. Three studies were
eliminated as a result of this process because they did not meet the inclusion criteria.

2.2.4 Characterising included studies

Reports meeting the criteria for inclusion in the third review had already been
keyworded using both EPPI-Centre generic and CPD review-specific keywords to
provide a broad descriptive map of the topic area of the studies in the review (refer to
Appendix 2.4 for CPD review-specific keywords and Appendix 2.5 for their
definitions). The review-specific keywords were modified after each of the earlier
reviews in order to make them more useful. All teacher data only studies included in
the third review (N = 14) were re-keyworded using the same set of review-specific
keywords to facilitate systematic mapping.

Core keywording: EPPI-Centre educational keywording system
Keywords, as defined by the EPPI-Centre, classify key characteristics of the studies from all reviews, including: language, country, topic, curriculum, sample population, characteristics of learners, educational settings and study type. Whilst there were subsequent refinements of these keywords between reviews one and two, the keywords remained essentially the same.

**CPD review-specific keywords: CPD processes and outcomes**

The Review Group extended the number of CPD review-specific keywords between each review. Those studies relevant to the third but excluded from the first review had fewer review-specific keywords than those in the second review, and the third review-specific set of keywords was more detailed still. To create a consistent and coherent map it was, therefore, necessary to re-keyword all studies using the same set of review specific keywords. This enabled us to categorise outcomes such as teacher attitudes, and staff/teacher understanding, knowledge and skills. Although the studies reported only on teacher impact data, the review-specific keywords: student/pupil achievement, motivation and learning were also included in order to highlight evidence in these areas arising from teacher self-report. We also identified review specific processes and activities and developed keywords that are detailed and defined in Appendix 2.5. These include: peer and specialist coaching; peer support; peer and specialist observation; joint planning; internal, external and specialist expertise; and mentoring. The full set of review-specific keywords is available in Appendix 2.4.

### 2.2.5 Identifying and describing studies: quality assurance process

Studies used in the third review had already had the inclusion and exclusion criteria applied to them. To ensure consistency between all three reviews, these decisions were cross-moderated and a further three studies excluded from in-depth review as reported above. Members of the EPPI-Centre assisted in applying criteria and keywords to studies for a sample of studies.

### 2.3 In-depth review

It was decided that all studies included in the systematic map would be included in the in-depth review as they had already met the criteria described in Appendix 2.1. However of these, 31 had previously been data extracted and included in the in-depth reviews for the first (N=17) and second (N=14) CPD reviews. Therefore data extraction and quality assurance for the third review was only completed on the 14 studies that measured only teacher outcomes.

#### 2.3.1 Detailed description of studies in the in-depth review

In order to focus on the included studies consistently and in some depth, data were extracted using standardised guidelines. The EPPI-Centre guidelines for extracting data and quality assessing primary studies in educational research version (EPPI-Centre, 2003) is a set of questions enabling a reviewer to draw out details of the aims of the study, the phenomena being explored, the nature and characteristics of the sample, the methods of analysis of the study, the outcome measures, results and conclusions. The data extraction was completed using EPPI-Reviewer software by two separate reviewers who then compared their results.
We believed that practitioners would want to know the answer to specific questions about the nature and design of the CPD, and the Review Group was particularly interested in details of the type of CPD intervention, the processes involved and the details of implementation. Because of this, and building on what we learnt through the process of the first two reviews, we decided to complement the methodological rigour of the EPPI-Centre data extraction guidelines with a new set of review specific data extraction questions in order systematically to pinpoint the detail of the CPD (Appendix 2.4). Having learnt from the previous reviews where we had needed to revisit the studies to mine further information, we refined the previous review specific questions in order to design new ones.

The EPPI-reviewer software allowed reviewers to interrogate the data from the extracted studies, according to the range of questions posed in the generic data extraction and review specific data extraction questions set.

2.3.2 Assessing quality of studies and weight of evidence for the main review question in relation to the teacher only impact studies

As in the first two reviews, reviewers were required to make a judgement on the following four questions relating to the Weight of Evidence (WoE) as defined by the EPPI-Centre:

- WoE A: Taking account of all quality assessment issues, can the study findings be trusted in answering the study questions?
- WoE B: Appropriateness of research design and analysis for addressing the question, or sub-questions, of this specific systematic review;
- WoE C: Relevance of particular focus of the study (including: conceptual focus, context, sample and measures) for addressing the question or sub-questions of this specific systematic review; and
- WoE D: Taking into account quality of execution, appropriateness of design and relevance of focus, what is the overall weight of evidence this study provides to answer the question of this specific systematic review?

WoE A aims to assess the quality of execution of a study for answering its own particular ‘study’ question, as unrelated to our review question. As a prompt, reviewers were reminded of some of their previous responses, automatically highlighted as part of the EPPI-Centre online process. This process proved useful in ensuring that reviewers were able to reflect on all the relevant information which had been extracted in relation to specific questions before arriving at decisions regarding the WoE.

WoE B and C are review-specific questions, assessing the appropriateness of the research design and the relevance of focus of the study in relation to this particular ‘review’ question.

WoE D is also a review-specific question, allowing an overall judgement of the WoE each study provides for answering the question of this systematic review. Reviewers examined their responses to WoE questions A, B and C to form an overall judgement of the study and define the WoE D during their data extraction, which they agree with a fellow reviewer during the review reconciliation process, in accordance with guidance provided by the EPPI-Centre members.
2.3.3 Synthesis of evidence in relation to a) teacher and pupil impact studies and b) teacher data only studies

Bringing together the findings of the review involved a two stage process. The first stage involved synthesising data from the studies data extracted for this review that only focused on teacher outcomes. The second stage looked across the findings relevant to collaborative CPD from all three reviews. In order to allow comparisons between the findings from the third review and those from the first two reviews, data were extracted from the studies for the following analytic categories, consistent with the first two reviews:

Impact of CPD on teachers and teaching, including any or all of:
- teacher attitudes, beliefs, commitment, self-efficacy, job satisfaction, morale;
- teacher knowledge;
- teacher approaches to learning; and
- teacher behaviours.

We also recorded any teacher perceptions of the impact of the CPD on pupil learning and any instruments used to structure such perceptions.

We looked across the findings from the two clusters of studies (i.e. those with pupil and teacher impact data from the first and second reviews, and those with teacher-only impact data from the current review) to pursue the four sub-questions described in section 1.6 relating to: types of aims, processes, outcomes and study design.

The synthesis also explored, where possible, issues which had been identified by members of the Review and Advisory Group including both practitioners and policy makers, as particular areas of interest. These included:

- the potential for using teacher data as a proxy for pupil data when evaluating CPD;
- the different patterns related to the characteristics of effective CPD practice across the findings of the three reviews;
- the patterns of planned and unplanned outcomes;
- the patterns of costs and benefits (although it was noted that this may be difficult to ascertain);
- the possibility of developing a typology of collaboration within CPD, building on the findings from the second review;
- the use and allocation of time;
- evidence about individual and general professional efficacy; and
- the location of CPD activities in teachers’ classrooms.

There were three further issues identified by the Review Group as relevant to the review:

- the relationships between approaches to research/evaluation design and CPD design across the findings of the three reviews;
- the matrix of relationships between all of the above and between the different types of findings associated with the types of study and types of CPD; and
- the characteristics of the evaluation models across the three reviews.

We want to revisit the findings to look at these issues as the year-long timescale laid down by the EPPI-Centre didn’t allow this in this particular review. We are hopeful that this is something we can do in the future if funding allows it.
2.3.4 In-depth review: quality assurance process

Training was provided for all reviewers who were working on data extraction, and a common study was used for the training days which could be compared and discussed in order to deepen understanding and develop a consensus about dealing with studies. Each member of the group completed data extraction on between two and six studies. Each data extraction and assessment of the WoE was conducted by pairs of reviewers working first independently and then comparing and reconciling their decisions before the study was uploaded. Members of the EPPI-Centre also assisted in applying criteria, keywording and data extracting studies for a sample of papers as part of the quality assurance process.
3 IDENTIFYING AND DESCRIBING STUDIES: RESULTS

All of the studies in the third review had already been identified in the first and second reviews by this group – and hence already included in either the map for review one or two. The comparative map of the studies in this chapter describes those studies (N = 45) reviewed in-depth across all three reviews (N= 17, N=14, N=14 respectively). Chapter 3 presents the combined results of the searches (conducted for the previous two reviews), the results following application of inclusion criteria, and a generic description of the characteristics of the included studies. Chapter 4 goes on to provide an in-depth analysis of the studies with teacher only data reviewed in-depth for this the third review, followed by comparative data which highlight the similarities and differences in the aims, processes, design and impact of the CPD between the studies with only teacher data and those with teacher and pupil data.

3.1 Studies included from searching and screening

Table 3.1 shows the combined total of studies retrieved and included/excluded for the first and second reviews. It also shows the studies which were excluded at the stage 2 screening for not giving pupil outcomes data in the first and second reviews, but which were included in the present, third review for their teacher-only data. For the third review, no further identification of abstracts or retrieval of reports was carried out. All reports which were keyworded for the third review only were also data extracted (N=14). The map includes all studies from all three reviews which passed all inclusion criteria at stages 1 and 2, plus the teacher-only data studies included in the third review.

Table 3.1: Studies included from searching and screening for this review

Sources of the studies

Studies taken from the in-depth review of EPPI 1: N = 17* (teacher + pupil outcomes data)

Studies taken from the in-depth review of EPPI 2: N = 14* (teacher + pupil outcomes data)

Studies data extracted for EPPI 3: N = 14 (teacher outcomes only)

3.2 Characteristics of the included studies

The detailed characteristics of the 45 studies included in the systematic map are presented in the tables within this section of the report.

The mapping encompasses those collaborative studies that reported teacher and pupil data, and included in the in-depth reviews for the first and second reviews, and those studies with teacher only data which have now been fully data-extracted for in-depth analysis in this, the third, review. These are shown in the Table 3.2

**Study source**

We have presented, in Table 3.3 the identification of all the studies in the third review. ERIC retrieved the most studies overall (N=23), however, as this database was the first to be used in searching for the first and second reviews, it gives a skewed version of how successful the other databases and methods of searching were, as they did retrieve studies that ERIC had already uncovered.

*For three studies collecting both teacher and pupil data the source of identification was unknown and is not included in these figures.

**Study type**

Studies with teacher and pupil data were mostly keyworded as *Evaluation: researcher-manipulated studies* (N=23), and about a quarter of the studies were keyworded as *Evaluation: naturally occurring*. Eight out of the fourteen teacher data only studies were researcher manipulated evaluations.

**Table 3.4: Description of the type of study in the systematic map (N=45)**

One study was coded as both a researcher-manipulated and a naturally occurring evaluation.

**Countries in which the studies were conducted**

As in the studies that measured teacher and pupil outcomes, most studies measuring only teacher data were conducted in the USA (N=9, 64% in teacher only studies compared to 58% in studies reporting pupil data), with the next most from the UK (N=2). One each were conducted in Canada, Taiwan, Jamaica, and The Netherlands.

</tr>
</tbody>
</table>

*Note: Some studies were set in more than one country*

**Educational setting**

Although focusing on teacher only data, the educational setting of the teachers was coded as this was relevant to the type of CPD they needed/received. The vast majority of teacher only data studies were focused on CPD for primary school teachers (N=9). Of the one keyword for “Other” educational setting, the CPD took place in a Science Institute and a Science camp – which were not elaborated on further.

**Table 3.6: Type of educational setting of the studies (N=45)**

</table>

*Note: Some research combines more than one type of educational setting*
**Topic focus**

As for the teacher and pupil data studies, all teacher data only studies were keyworded as focusing on Teacher careers (N=14), as they all covered CPD, which is inextricably linked to career. Nearly all studies with teacher only data also focused on teaching and learning (N=11), as did all of the studies with teacher and pupil data (N=31). The next most popular focus of all studies was curriculum (teacher only data N=9, teacher and pupil data N=24). The particular curriculum areas focused on is broken down in Table 3.8. The rank order is similar but few studies with equal opportunities as a focus featured teacher data only (N=2) whereas ten studies of teacher and pupil data focused on this area. Perhaps this reflects the fact that equal opportunities is an area more strongly related to pupil outcomes than to staff outcomes. Organisation and management was not a topic focus for studies with only teacher data.

**Table 3.7: Topic focus of the studies in the systematic map (N=45)**

**Note:** Some research combines more than one type of focus.

**Curriculum focus**

Once again, mathematics was a popular area of focus for the included studies. Having been the most frequent curriculum focus in the teacher and pupil data studies (N=7), it was also the most frequent in the teacher only data studies (N=4), a relatively higher proportion. The spread across the curriculum was not as great for the teacher only data studies as for the teacher and pupil data studies, which may have reflected the fact that most of the studies in the third review involved primary schools rather than secondaries. Whilst two studies each focused on literacy–first languages and science, and one study was cross-curricular, overall fewer teacher only data studies focused on curriculum in the third review.

**Table 3.8: Curriculum areas of the studies in the systematic map (N=33)**

3.3 Identifying and describing studies: quality-assurance results

Ambiguities which had been cleared up in the previous review were checked again in the present review for those studies which had come from the first review. This particularly covered keywording all studies as concentrating on learners - including the teachers as learners, as undertaking CPD is a learning process. The age-groups of participants led the “over 21” option to be used as a keyword specifically for teachers taking part in the study, hence all studies in the map have this keyword. Although many of the teacher data only studies did give the ages of pupils, taught by the teacher participants, as the studies did not show pupil outcomes of the CPD, their ages were not coded for in the third review. One can assume the general age groups taught by the teachers from the school(s) they taught at (See Table 3.6).

All studies had already been keyworded by at least two different reviewers, with some keyworded by the EPPI-Centre (14 in EPPI 2). The keywords had all been reconciled and uploaded to the database, but to ensure consistency across the different reviews, keywords were all checked again for the present review. **Three studies were eliminated as a result of this process because they did not meet the inclusion criteria.**
4 IN-DEPTH REVIEW

This chapter firstly presents in greater detail the specific characteristics of the teacher only studies data extracted and synthesised in the third review of CPD (section 4.1). We synthesise these findings in section 4.2.1. Finally in sections 4.2.2 and 4.3 we compare characteristics across the two groups of studies (ie those which explored the impact of the CPD on teachers and those which restricted the research to impact on teachers) as they relate to the:

- study aims
- CPD interventions
- outcomes
- designs.

Because many of the CPD interventions involved a large number of different components confident analysis of which components are the effective ones is not possible until studies start to unpack further their interventions. What we are able to do is identify which components recur in programmes with positive outcomes with what frequency.

4.1 Further details of studies included in the in-depth review

This section looks in more detail at the group of studies in the in-depth review which explored impact on teachers but not on students (N=14). Further characteristics of the studies that explored the impact of CPD on both teachers and students can be found in the previous reviews (Cordingley et al. 2003, 2005).

Building on existing knowledge: use of research literature to inform the studies

One of the criteria for inclusion related to the extent to which the study demonstrated that ‘researchers have used what is known already’, for example, by including a literature review. Appendix 4.2.2.3 gives more information about the use of research literature to inform the CPD and/or the studies.

All the reports referred to previous research or literature as informing the studies. Of these, four were located within a single particular model of professional development.

Specifically:

- Farmer et al. (2003) discussed a preliminary impact study conducted in relation to the same project together with theoretical perspectives about how mathematics teachers develop their own learning;
- Goodell et al. (2000) referred to a model of professional development called the Ohio Statewide Systemic Initiative (SSI) known as Project Discovery and drew on research related to inquiry teaching in mathematics;
- Morin (1998) referred to a theoretical model developed by the researcher previously and to other research into educational change, adult learning and past professional development practice; and
- Swafford et al. (1997) discussed literature about peer coaching which directly informed the CPD.

The other ten studies were informed by a more extensive range of models from the literature.

Specifically:
• Greenwood and Haury (1995) referred to a range of research about inquiry teaching in science (for the content of the CPD) and to other research related to peer support and coaching (for the processes of the CPD);
• Hawkes and Romiszowski (2001) described a wide range of literature and research about collaborative CPD, particularly where it involved professional conversations and reflection; further research was highlighted with reference to participation in computer-mediated dialogue;
• Henson (2001) explored literature and research relating to exploratory teacher research, sustained collaborative professional development and teacher self-efficacy; the study also used tools drawn from the research literature;
• Lin (2002a) was informed by empirical research about teacher education and the creation of cases and by theoretical studies related to teacher learning through reflection, cognitive conflict and social interaction;
• Lloyd (2002) referred to literature about professional development with a particular focus on action research and critically reflective practice;
• Lloyd et al. (2000) referred to research about teacher confidence and understanding in science contexts – including the processes of science - and about self-efficacy;
• McLymont and Costa (1998) described a wide range of theoretical studies exploring professional development, discourse, collaboration and coaching;
• Turvey (1996) referred to a wide range of research and other literature related to professional development of teachers to promote greater inclusion;
• Vaughn et al. (1998) reviewed literature covering the needs of special learners, teachers’ responses to needs and professional development models for teaching special learners; and
• Xu (2003) referred to previous research relating to the conflict between demands on teachers and opportunities for professional growth, models of professional development and teaching portfolios.

Seven of the studies that built explicitly on the literature were rooted in scholarship and evidence about CPD. Three were rooted in evidence about teaching and learning and one was concerned with both.

**Characteristics of the teacher data only studies**
The CPD interventions, although separately conceived for different purposes shared many characteristics as shown in table 4.1. All studies except one used specialist expertise and it was unclear in the exception. Twelve studies used peer support and the same twelve studies reported joint planning as part of the CPD. Whilst it was a characteristic of about half of the CPD interventions, interestingly, peer observation was not always part of the peer support process. Half of the studies also used peer coaching as a significant component of the CPD. In two cases the studies which did not use peer support were subsequently excluded for low weight of evidence.

**Consultation with teachers about CPD**

Consultation with teachers took place in all of the CPD studies. It took several forms, as shown in the table below (table 4.2), the most common of which was to find out what the teachers knew and could do already. The CPD programmes that did involve consulting the teachers about their learning often did so in multiple ways: about teachers’ own starting points for the CPD, the pace of the CPD or the scope of the CPD. In over half the studies it appears that some teachers themselves took on at least some aspects of the CPD. Evidence from the studies suggested this was classroom level leadership within a strategic framework.

Reflection and experimentation

The importance of experimentation began to emerge in the second CPD review (Cordingley et al., 2005) where it began to appear that those programmes that focused exclusively on reflection and dialogue were linked to less successful outcomes than those that also included active experimentation with new approaches. This led us to explore whether any of the teacher-only data studies were focused on reflection to the exclusion of experimentation. Our analysis of the CPD processes revealed a spectrum of activity between the two extremes. The spectrum comprises:

- reflection,
- learning from theory / other people’s research,
- structured professional dialogue,
- shared planning as a learning activity; and
- experimentation.

Most of the CPD programmes covered by the review studies involved some core activities from the action end of the spectrum. All involved structured professional dialogue as a learning strategy. All but one (Xu, 2003) involved experimentation. However Xu’s study did involve a high degree of collaborative planning. Only one CPD programme from this group of studies (Goodell et al., 2000) did not involve reflection as an explicit learning process. This programme focused almost entirely on experimentation and dialogue. Six programmes involved direct use of theory and research evidence. The use of planning as a learning activity that bridges theory and reflection and practice and experimentation was evident in eight of the studies.

**Data Collection and Analysis**

Nine studies used both qualitative and quantitative methods of data collection and analysis. Those studies which only used qualitative methods used a number of data types in order to triangulate their findings. For example, Lin (2002a) used group and individual interviews, observations and self completion reports. Three studies which aimed to develop specific teacher knowledge and skills (Greenwood and Haury, 1995; Lloyd PJ, 2000; Turvey, 1996) employed tests or another form of assessment to measure the changes in teachers’ performance. Data were analysed using a grounded theory approach. Swafford et al. (1997) analysed qualitative data from observations, interviews and reports using a coding process to facilitate the comparison of the data across all sources. Typically, combined qualitative and quantitative approaches made use of questionnaires and pre and post teacher assessments supplemented in most cases by observations and interviews and analysed statistically after establishing reliability and validity. For example Goodell et al. (2000) used interviews, observation and questionnaires. The quantitative data were analysed using factor analysis and the qualitative data were analysed using NUD*IST or similar software.

Of the fourteen studies in the in-depth review, three have been excluded from the synthesis because of their WOE ratings. Lloyd (2002) was rated low WOE both in relation to the study's own trustworthiness and in relation to the review specific
question about appropriateness of research design. Turvey (1996) was excluded for the same reasons. Hawkes and Romiszowski (2001) was rated low for the two review specific questions about research design and about relevance to the review, and so was excluded. Of the eleven studies included in the synthesis two (Lloyd et al. 2000, Swafford et al. 1997) were high WOE and nine were medium WOE.

4.2 Synthesis of Evidence

As outlined in the protocol for this review, bringing together the findings of the review involved two phases. In the first phase we synthesise the data from the eleven higher weight of evidence studies which present data in relation to the impact of the CPD on teachers but not on students in relation to our umbrella question: What is the impact of sustained, collaborative CPD on teachers and teaching?

Because we go on in part two of the analysis to compare the types of outcomes across all three of the reviews we have categorised them here for later comparative purposes. We report on impact in relation to:

- Affective Impact - teacher attitudes, beliefs, commitment, self-efficacy, job satisfaction, morale
- Teacher Behaviours: classroom teaching, collaboration

In the second phase we consider the studies used for synthesis across the three reviews. We compare data from studies which provided evidence of pupil outcomes with those focusing on teacher impact only to pursue the four sub questions, taking into account both the nature and the content of the studies:

- aims of the studies
- CPD processes and activities
- outcomes
- study designs.

In each case we will be looking to see if there are differences between Reviews 1 plus 2 taken together (teacher and pupil) and Review 3 (teacher only) which might highlight characteristics of research into collaborative CPD which is designed to explore impact on pupils and learning; and research which is designed only to explore impact on teachers and teaching.

4.2.1 Synthesis of evidence from teacher only data studies

This synthesis of the data from the studies that measured only teacher data, asks the question:

What is the impact of sustained collaborative CPD on teachers and teaching?

In order to answer the question, we synthesise data from the eleven studies which were judged to have high or medium weight of evidence. Any differences between numerical data in the synthesis and descriptive data in section 4.1 are because three low WOE studies were excluded from the synthesis. In the first section we report briefly on the aims of the research. We then go on to report on the outcomes in relation to impact based on the same framework of characteristics as that used in our first two reviews: teachers’ motivation, confidence, attitude, beliefs, and practice.
Aims
In six studies (Farmer et al. 2003, Goodell et al. (2000), Greenwood and Haury (1995), Henson (2001), Morin (1998), Xu (2003)) the research aims were primarily concerned with the evaluation of a particular CPD design or approach in the context of a curriculum-based goal. In four cases (Lin, 2002a; Lloyd, 2000; McLymont and Costa, 1998; Vaughn et al., 1998) the CPD studies were directed primarily at the improvement of a particular aspect of the curriculum or teaching strategies, using the CPD as the vehicle for improvement. In one study (Swafford et al., 1997) the research appears to be targeted equally at the focus for improvement (literacy) and the CPD (peer coaching.)

Findings
In nearly all cases the findings are reported across a range of teacher outcomes (see below) and the researchers draw conclusions about the CPD design in relation to these. Because we go on in part two of the synthesis to compare the types of outcomes across all three of the reviews we have categorised them here for later comparative purposes in two broad clusters: behavioural and affective.

Impact on teacher behaviour:
Teaching
In all but one of the studies the teachers involved in the CPD interventions changed or substantially developed aspects of their teaching. In Xu’s study (2003) the focus was on the promotion of professional collaboration per se. Although the intervention was successful in achieving this aim, and hence in influencing teachers’ professional (collegial) relationships and their approach to their own learning, there are no data reported about impact on teaching behaviours.

Developments in teaching practice covered a broad terrain:

- improving mathematics instruction by means of inquiry (Farmer et al. 2003, Goodell et al. 2000)
- developing activity-based, inquiry-oriented science teaching (Greenwood and Haury 1995)
- implementing specific, research-based classroom interventions (Henson 2001)
- learner-centred approaches to teaching mathematics (Lin 2002a)
- teaching process skills in primary science (Lloyd et al. 2000)
- improving mathematics teaching through cognitive coaching (McLymont and Costa 1998)
- implementing new instructional strategies (Morin 1998)
- improving literacy teaching via the literacy instruction framework (Swafford et al. 1997)
- enhancing the quality of instruction for students with learning difficulties in the general classroom (Vaughn et al. 1998)

Reflection and collaboration
Some of the studies emphasised commitment to continuing professional collaboration and reflection as an outcome as well as a CPD process

- Lin (2002a) found that collaborative, school-based action research, using case writing, enhanced teachers’ understanding of students’ learning and enhanced their reflective thinking about their teaching.
• McLymont and Costa (1998) reported increased collaboration and reflection amongst the maths teachers participating in cognitive coaching.
• Morin’s (1998) CPD model (Sherwood School’s Project Learn) resulted in teachers’ increasing collaboration and sharing.
• Swafford et al.’s (1997) peer coaching programme resulted in improvements in literacy teaching with concomitant changes in teacher confidence, collaboration and reflective discussion.
• Xu’s (2003) study was directly focused upon generating sustainable collaboration as a means of building and expressing professional identity. Teachers in this study became more collaborative in their everyday practice, for example coming together at lunchtime to discuss their teaching.

Affective impact
All of the studies reported observable and self reported changes in at least one of the affective aspects of professional learning:
• motivation;
• confidence;
• attitudes and beliefs

Because the studies focused on teacher impact we wanted to explore affective outcomes for any new evidence about this important but under-explored aspect of professional learning. All the studies used a number of methods to measure impact. For example,
• Greenwood and Haury (1995) aimed to change primary teachers’ attitudes to science. The researchers monitored the changes through interviews carried out during the programme and follow-up questionnaires.
• Henson (2001) used interviews and questionnaires complemented by observation to assess teachers’ self-efficacy in teaching behaviourally-challenging students.
• Swafford et al. (1997) conducted a peer coaching programme for teachers of literacy in primary schools. Data were collected through interviews supported by classroom observation.

We also noticed that seven of the teacher only studies in the synthesis (N=11) collected data during the intervention in contrast to three of the teacher and pupil data studies (N=26). In the event few studies reported affective impact across more than one aspect.

Teacher motivation
Two studies highlighted the motivating impact of the CPD intervention:
• Vaughn et al. (1998) found teachers to be extremely positive about the year-long teacher research programme. They were motivated by perceived improvements in the students’ learning and keen to continue the project in the next year.
• Xu (2003) found that teachers developed a renewed ‘sense of purpose’ and felt ‘energised’ to take risks and to examine their practices on an ongoing basis.

Teacher confidence:
Four studies identified changes in teacher confidence as a direct outcome of the CPD intervention:
• Greenwood and Haury (1995) found evidence of increased confidence and positive attitudes towards science teaching amongst programme teachers who experienced Project Discovery compared with those who had not
experienced the intervention programme. They went on to involve themselves in peer teaching, delivering inservice workshops and many gained positions as science specialists in their schools.

- Henson's (2001) study found teacher participation in research to have a powerful impact on teacher efficacy and levels of collaboration in an alternative school (SEN) setting.
- Lloyd (2000) found that as teachers’ understanding of process skills in science increased, their overall confidence in their ability to teach these skills diminished but that they developed greater confidence in their ability to identify process skills and target them in their teaching.
- Swafford et al. (1997) reported increases in teachers’ confidence. “After a year they are all more confident about the methods they use, their understanding of why methods are powerful and the decisions they make.”

**Teachers’ attitudes and beliefs**

Three studies identified specific changes in teachers’ attitudes to and beliefs about their teaching:

- The teachers in Farmer et al.’s (2003) small scale, case-based study of inquiry-oriented maths teaching changed their attitudes and beliefs about what constitutes ‘good’ mathematics teaching and became more thoughtful and self critical.
- Goodell et al.’s (2000) larger-scale controlled trial also found evidence of attitudinal change amongst the project teachers who not only profoundly changed the way they taught but were more reflective about how they taught.
- Morin’s (1998) CPD model (Sherwood School’s Project Learn) resulted in teachers changing their beliefs about assessment

**CPD Processes and Activities**

To ensure consistency within the syntheses across the three reviews the same analytic framework was used to synthesise the findings of the studies that only measured teacher outcomes data, as that used to synthesise the data from studies in the first two reviews. There was a high degree of consistency across the eleven studies in the synthesis in respect of their use of:

**Peer support**
- all the CPD interventions made use of peer support.

**Experimentation and Action Research**
- all the interventions made explicit mention of involving the teachers in applying and refining new knowledge and skills and experimenting with ways of integrating them in their day to day practice. Six studies involved action research.

**Taking account of teachers’ concerns and starting points**
- 10 of the interventions involved consultation with the teachers, either about their own starting points, the focus of the CPD, the pace of the CPD or the scope of the CPD. In the case of Goodell et al. (2000) it was unclear how far the teachers had been consulted about the details of the CPD intervention.

**Specialist Expertise**
- 10 of the CPD interventions made use of specialist expertise. In Xu’s study of the use of portfolios the extent of expert input into the design of the intervention is unclear

**Observation and reflection**
In nine cases specific mention was made of teachers observing one another; in four studies observation and reflection (as part of the CPD rather than exclusively focused on data collection) involved specialists. (See Tables 4.1 and 4.3 for details of the CPD interventions; further details can be found in Appendix 4.2.2.2)

**Researchers’ conclusions about their CPD designs**

Without further research in which the components are treated as independent variables it is not possible to measure their individual impacts. In addition, the lack of control or comparison groups in many studies makes it difficult to assess the effect of confounding variables. Nonetheless, these were the CPD processes which the researchers themselves considered, in the light of their findings, to have been particularly influential in achieving the desired impact on teachers and teaching:

**Action research**
- teacher research may be a particularly powerful method of professional development that can ‘impact teacher efficacy’ (Henson 2001, p 834)
- case construction (using observation, discussion and refining – access to other teachers’ perspectives) is a ‘potential factor’ in the source of the changes in the teachers’ ways of thinking and in the breadth and depth of pedagogical content knowledge’ (Lin 2002a, p 345)

**Peer support or co-coaching**
- ‘the benefits of peer coaching make it an important element of staff development programmes in which teacher change is the goal’ – in this case teachers improved their literacy teaching, grew in confidence and became more reflective about their practice. (Swafford et al. 1997, p 425)
- ‘coaching, in-class demonstration lessons and a supportive community of other teachers and professionals’ led to sustained changes in teacher practice around inclusion (Vaughn et al. 1998, p 59)
- cognitive coaching ‘…a non-judgemental process built around a planning conference, observation and a reflective conference….whereas prior to PDP teachers utilised the direct teaching methodology as their chief way of helping students to learn…..they are now allowing the students to learn by understanding for themselves the concepts they need to learn.’ (McLymont and Costa 1998, p 20)
- teacher collaboration around student portfolios ‘illustrates the potential of this approach in providing purpose, focus, and substance along with a sense of ownership and belonging in which teachers learn with and from each other’. (Xu 2003, p 357)

**Consulting Teachers**
- taking teachers’ personal and professional needs into account helped ensure that they internalised what they learnt and so were able to shift their beliefs and their teaching (Farmer et al. 2003)

**Combining different elements:**
- sustained professional development, with continued involvement and support through follow-up activities and networking opportunities resulted in profound changes in teaching practice and teacher beliefs (Greenwood and Haury 1995)
- a combination of direct instruction, partnership work and equipment provision ‘ can produce a significant change in teachers’ understanding…’ (Lloyd 2000, p 367)
Morin (1998, p 8) believed that a number of factors were important, in combination: ‘…Features that are consistently associated with….successful teacher change: self-directed learning, individual and group introspection, continuous professional interaction, a well-defined knowledge base….participation in curriculum development, classroom-based trials, adequate support and resources and ongoing feedback…resulted in a range of changes: reorganisation of spaces to facilitate collaboration; increased sharing and collaboration; new instructional strategies.’

Nature of Collaboration
In the second review (Cordingley 2005) we began to explore the nature of collaboration in more detail and developed some very tentative hypotheses about the nature of effective collaboration based on what we found out about the interventions. These were:

- CPD with a significant in-school component may be more effective than CPD which is mainly off-site even if the latter involves teachers working together;
- collaboration between teachers which is focused around active experimentation may be more effective in changing practice than reflection and discussion about practice;
- collaboration may be an effective vehicle for securing teacher commitment and ownership of CPD in cases where it is not possible for the teachers to select a CPD focus of their choice; and
- paired or small group collaboration may have a greater impact on CPD outcomes than larger groups.

Our intention, as we stated in the second review, was to test these propositions in the light of what we discovered about the nature of effective collaboration in relation to its impact on teachers and teaching but not on pupils. In exploring the components of CPD which are linked to positive outcomes we looked for recurring patterns and connections between activities and outcomes in a range of studies. To establish causal relationships among the components and the outcomes further research will be necessary. Therefore we interrogated the data from the group of studies in this review (which reported on teacher outcomes but not on student outcomes) as follows:

Was the collaboration between teachers and between teachers and specialists off-site, in the teachers’ own classrooms or both?
Eight of the studies reported interventions which took place in the teachers’ own schools. (Henson (2001), Lin (2002a), Lloyd et al. (2000), McLymont and Costa (1998), Swafford et al. (1997) Xu (2003) Goodell et al. (2000), Morin (1998)). In two of these teachers were also involved in CPD off-site (Goodell et al. 2000 and Morin 1998). In one study (Greenwood and Haury 1995) the teachers worked off-site with their own students and in two studies it is unclear. (Farmer et al., 2003, Vaughn et al.,1998).

In general this finding is consistent with the proposition that CPD seems to be effective when it has a significant in-school component.

Did the collaboration involve experimenting with and adapting/improving different teaching approaches, was it purely reflective/discursive or was it a combination of both?
The majority of the studies combined reflection and discussion about practice with active experimentation in classroom practice (Farmer et al. (2003), Goodell et al.
This is consistent with both the in-school location of the collaborative CPD (so teachers have an opportunity to work with their own students) and the trend towards paired collaboration (which enables teachers to review issues arising from observation in a non-threatening environment). It is also consistent with the hypothesis that active experimentation may be effective in changing practice.

**Did it involve groups of teachers, pairs of teachers or other combinations?**

Teachers working in pairs was the most common form of collaboration although it was unclear in two of the studies what the unit of collaboration was. In some of the larger studies there were opportunities for collaboration in larger groups as well. Greenwood and Haury (1995) reported a 3-phase programme, starting with a one-year collaborative planning phase, followed by a one-week Science Institute. In phase 3 the teachers applied their new knowledge and skills with two teachers supporting each other in leading student activities. Lloyd's (2000) study also involved 3 phases. The first phase was devoted to reviewing teachers’ starting points and developing a framework for evaluating children’s learning; in phase 2 teachers planned, taught and observed each other in pairs in their own classrooms and in phase 3 teachers and their head teachers met together for an evaluation session.

**Voluntarism**

In all but two of the studies (Morin 1998; Xu 2003) teachers were voluntary participants in the CPD intervention. However it seems clear from the researchers’ reports of affective impact that the collaborative processes involved in the CPD models, together with the new knowledge and understanding experienced by the teachers were effective in achieving teacher ownership in all cases.

**The nature of collaboration**

The frequency of these patterns and incidences across the two reviews do not constitute evidence of cause and effect. However they have increased our understanding of the nature of effective collaboration to the point where we feel more confident about our four propositions.

**Student gains**

This phase of the synthesis was also intended to record any teacher perceptions of the impact of CPD on pupil learning and any instruments used to structure such perceptions. However a search through the original studies revealed scant information – a few passing references in some studies to ways in which the teachers were encouraged by perceived student responses to new approaches, which were not sufficient to warrant inclusion.

**4.2.2 Comparison across the findings from both clusters of studies (Reviews 1 plus 2 and Review 3)**

In this phase of the analysis we look across the findings from the two groups of studies in relation to our four sub questions. Because we are committed to working with a significant quantity of good quality evidence we compared studies which were judged to have overall high, medium-high or medium weight of evidence, and to omit those where there was a judgement that the weight of evidence was low.
First, (although we did not set out to do this in the review protocol) we have compared the literature bases of the two groups as we noticed distinct patterns and decided that the comparison might have the potential to help us understand and account for other differences when we came to look at the comparisons in the sub questions. We divided the literature into broad categories: that which related to models and processes of CPD and adult learning: and that which related to pedagogy and pupil learning. (see table 4.6)

<table>
<thead>
<tr>

</tr>
<tr>
<td>7</td>
</tr>
<tr>
<td>(see Appendix 4.2.2.3)</td>
</tr>
</tbody>
</table>

The comparison figures are:
- Teacher + pupil - 19% about the CPD, 38% about the teaching and learning strategies and 42 percent about both
- Teacher only – 64% about the CPD, 27% about the teaching and learning strategies and 9 percent both.

There appear to be two broad fields of research here. One group focused on changes in the teaching and learning generally treats CPD as one of several interesting variables. The thrust of these studies appeared to be towards how to bring about a desired change in pupils’ achievement and teachers’ practice in a particular area of teaching and learning. The other group generally functions more as a set of evaluations of CPD in terms of teacher change. In this latter set the teaching and learning processes feature much less prominently than the CPD processes.

The CPD programmes where pupil and teacher data were collected paid more attention to pre-existing evidence about teaching and learning than those where teacher only data were collected. 80% of the former group use the literature on
teaching and learning directly in designing the intervention, compared with 36% of the latter. Since we do not know, in the teacher data only studies, what the impact on pupils was, the lack of attention to the pedagogic research base may or may not be an important aspect of the study. It may be that the teacher only studies did refer to pedagogic literature but didn’t have room to report it in the article. But since they give considerable space to reporting the CPD literature this seems unlikely.

Broadly speaking, of the two groups of studies:

- the CPD evidence in the teacher and pupil data studies is less granular. Users looking to these studies to inform their CPD will look harder for more detail about the nature of the intervention and its underpinning rationale;
- the teaching and learning evidence in the teacher-only data studies is less textured and hence likely to be less persuasive to a user audience.

Our own reading of these trends is that, in future, studies of CPD should incorporate and build equally upon the pedagogic and the CPD literature. In other words, studies that evaluate specific CPD programmes need to problematise the nature of the changes in pedagogic practice as well as the CPD processes. Similarly studies of the development of teaching and learning need to problematise the CPD processes and interventions and to collect and analyse data about them if they are to provide research users with the information they need to operationalise findings and recommendations.

We had wondered whether the teacher only data studies would provide evidence about teacher perceptions of impact upon students. We wondered too whether a close relationship between such data and data from the previous reviews would enable us to form a view of how far teacher only data could act as a proxy for pupil impact data. In fact very few data about teacher judgement of impact upon students were recorded. However, the processes used in the effective CPD in both groups of studies were consistent. It may be that these characteristics of CPD, in combination, could be used on an experimental basis as a framework for evaluating the potential usability and utility of CPD plans and proposals.

The four comparative sub questions were addressed as follows.

4.2.2.1 Do the studies of the three different reviews provide evidence about different types of aims for the CPD depending on whether they explore only the impact on teachers and teaching, or explore the impact on teachers, teaching and pupils?

<table>
<thead>
<tr>
<th>Aim</th>
<th>Teacher + pupil studies</th>
<th>Teacher studies</th>

<td>N=11 7 Farmer et al., 2003; Goodell et al., 2000; Greenwood and Haury, 1995; Henson, 2001; Morin, 1998; Swafford et al., 1997; Xu, 2003</td>
</tr>
</tbody>
</table>
The two samples diverged absolutely, of course, with regard to whether they set out to explore whether CPD programmes had an impact on pupil learning.

There are, nonetheless, some broad similarities with regards to the aims of the two samples (studies that collect pupil impact data and those that don’t) in relation to:

- the impact of a specific teacher development programme (teacher + pupil = 58%, teacher = 64%); and
- the impact on teaching and learning of introducing specific pedagogic strategies (teacher + pupil = 54%, teacher = 45%).

</tr>
</tbody>
</table>

(see also Appendix 4.2.2.1)

**Note:** some studies had more than one aim stated. This table combines primary and secondary aims.
But the two samples are more distinctive in relation to whether they set out to explore CPD that aimed to:

- develop teachers’ knowledge, understanding or skills (teacher + pupil 35%, teacher 64%); and
- change teacher beliefs or attitudes (teacher + pupil 12%, teacher 64%).

The implication seems to be that CPD explored by studies that focus on teacher only data is aimed more explicitly at changes such as teacher knowledge, beliefs and understanding which can not be directly observed.

We are not clear about the reason for these differences although it seems likely that the primacy of the goal of affecting pupil learning in the teacher + pupil samples may have stood as a proxy for evidence about these largely implicit phenomena in those studies. By contrast the teacher studies might have set out to provide direct evidence about these phenomena as a proxy for direct pupil data.

It should also be noted that almost all of the studies collected data about teacher knowledge, understanding and skills whether or not this was an explicit goal of the CPD programme.

### 4.2.2.2 Do the studies of the three different reviews provide evidence about different types of CPD processes and activities depending on whether they explore only the impact on teachers and teaching, or explore the impact on teachers, teaching and pupils?

</tr>
</tbody>
</table>
The key strategies used in the two samples (teacher + pupil and teacher) are similar in relation to:

- the use of specialist expertise (teacher + pupil 100%, teacher 100%)
- observing others teach (teacher + pupil 77%, teacher 82%)
- peer support (teacher + pupil 100%, teacher 100%) and
- the use of workshops and seminars (teacher + pupil 58%, teacher 64%).

</tbody>
</table>

(see also Appendix 4.2.2.2)
But there was a much greater explicit emphasis on action research in teacher only studies (teacher + pupil 23% and teacher 55%). However, it should be noted that although a limited number of programmes described the CPD as action research, the activities described in many programmes as peer support or peer coaching actually bear many similarities to those described as action research.

In the light of this pattern we have found nothing in this review to cause us to question the findings or conclusions about the processes and activities involved in effective CPD from the first two reviews of studies which looked at both teacher and pupil impact. On the contrary the evidence from this group of studies reinforces the findings about the nature of effective collaborative CPD.

4.2.2.3 Do the studies from the three different reviews provide evidence about different types of outcomes for the CPD depending upon whether they explore only the impact on teachers and teaching, or explore the impact on teachers, teaching and pupils?

Table 4.9 Outcomes from the CPD

</tr>
</tbody>
</table>

(see also Appendix 4.2.2.4)

There are more differences in the outcomes between the two samples. Only 38% of teacher + pupil studies focused upon affective outcomes as compared with 100% of teacher studies. It seems likely that the need to focus upon pupil
outcomes has squeezed this aspect of learning lower down the priority list for the teacher + pupil sample.

The pattern is much more similar in relation to teacher behaviours and actions in classrooms. In the teacher + pupil samples 100% of the studies targeted changes in teacher behaviour. In the teacher sample 91% of the studies targeted changes in classroom behaviour.

4.2.2.4 Are there any differences in patterns of study design between studies that investigate the impact of sustained collaborative CPD only on teachers and teaching, and those that explore both the impact on teachers, teaching and pupils?

| (see also Appendix 4.2.2.5)                                         |                                                                                        |                                                                                        |

All the studies were evaluations.
- Of the teacher and pupil studies 85% were researcher manipulated evaluations and 15% were naturally occurring;
- Of the teacher only studies 64% were researcher manipulated against 36% naturally occurring.

When comparing the use of control or comparison groups:
• 58% of the teacher and pupil studies used them, while
• only 18% of the teacher studies did so

When comparing when data were collected, before and after or after only collection of data was fairly similar (teacher and pupil studies – 92%; teacher only studies – 82%), but the teacher only studies were much more likely to collect data during the study (teacher and pupil studies - 12%; but teacher only studies – 64%). It is probable that this greater emphasis on collecting data during the study is a reflection of the goal of evaluating the CPD processes. It may also be linked to the primacy of the aim of creating affective changes among the teachers reflected in the teacher only studies as compared with the highly specific aim of improving students’ achievement that features in the teacher and pupil data studies. We offer the suggestion that where the CPD is being evaluated the study may be more exploratory, more qualitative, without control groups, more focused on processes and with fewer of the constraints that occur when something is implemented with a specific goal in mind.

Length of CPD intervention

Whilst comparing the study types we became aware of differences in the duration of studies, which are presented in table 4.10. Whilst one of the studies focusing on teacher and pupil impact was planned to last for three years, the vast majority of the studies were a year or less in duration. By contrast all the teacher only data studies lasted for at least a year, with several lasting considerably longer.

(see also Appendix 4.2.2.5)

*This was a rolling CPD programme which grew substantially in number of participants and involved some repetition of CPD activities
**Teachers could choose to participate for 1 or 2 years
In summary the comparative figures are:

- under one year: teacher and pupil 35%, teacher only 0%;
- one to two years: teacher and pupil 50%, teacher only 45%
- two years or over: teacher and pupil 15%, teacher only 55%

Given that the teacher + pupil data sample studies recorded very positive outcomes for the teachers and students involved and the general moral pressure in education for improvements in practice to happen quickly in order to increase the learning achievement of all pupils, the costs and benefits of longer timescales need careful scrutiny. It is particularly interesting that both the research and the CPD continued for these extended periods, suggesting an intimate link between the researchers’ interests in the data and their engagement in supporting the CPD. Perhaps there is a model of formative research and assessment implicit in these studies?

We are not sure how to account for this marked difference between the two groups of studies. One hypothesis is that, freed from the need to pursue pupil impact data, the research teams no longer need to match teacher and student cohorts so that research beyond academic year boundaries becomes much more possible. Similarly, the lack of a requirement to develop research instruments spanning pupil variables may have freed resources for extended follow up.

Alternatively, it may be that studies which are measuring impact on students are more concerned with the immediate learning or behavioural effects of the intervention. It may also have been the researchers’ hypothesis that deeply internalised teacher change takes much longer than student learning. Unfortunately the studies do not provide an explanation for their choice of duration for either the programme or the study. This is clearly an important resources consideration of considerable interest to both research funders and practitioners; one which we explore further below.

4.2.2.5 Discussion

Part of the rationale for this review was to explore the differences and similarities between two groups of studies: those which explore impact on students; and those which confine themselves to exploring impact on teachers. The comparison does depend on what is reported in the studies and it is possible, for example, that studies may have measured both teacher and pupil outcomes but not included pupil outcomes in the report. However, our analysis of the studies suggests that this is unlikely.

There were striking similarities between the groups of studies, notably:

- all of the studies reported positive impact on their target population/s
- the combination of CPD processes:
  - specialist expertise;
  - peer support;
  - observation and reflection;
  - action research;
  - professional dialogue;
  - consultation with teachers and acknowledging teachers’ starting points;
- the nature of effective collaboration, specifically:
  - working on-site and in classrooms
  - working in pairs and small groups
There were also some clear differences between the two groups, most notably:

- the theoretical and empirical research literature on which the research drew;
- aspects of the study designs, e.g., data collection frequency;
- the length of the research and the CPD intervention.

We also wanted to find out whether the teacher only data studies would provide evidence about teacher perceptions of impact upon students. If this were to be the case and if there were close similarities between these data and data from the previous two reviews we hoped to be able to form a view of how far teacher only data could act as a proxy for direct pupil impact data. In the event very few data about teacher judgments about the impact on students were recorded. However the processes used in the effective CPD in both groups of studies were consistent. It may be that these characteristics of CPD, in combination, could be used on an experimental basis as a framework for evaluating the potential usability and utility of CPD plans and proposals.

4.3 In-depth review: quality assurance results

Following initial moderation of the data-extracted studies, most differences between reviewers (including EPPI-Centre reviewers) were of a relatively straightforward nature to resolve. As in the other two reviews, the most common occurrence was when reviewers selected ‘no’ based on their judgement, as opposed to ‘not stated’ or ‘implicit’. This was especially relevant in the Review Specific data extraction questions although the refined questions we used for the third review left less room for different interpretations. There were also occasionally differences in judgement between reviewers, for example, when assigning the WoE. This was related to the number of options it was possible to select. As with the keywording quality assurance, all the differences were reconciled by discussion, involving a third person where necessary. When decisions had been reconciled, the details supplied by the different reviewers were combined thereby producing the final data extraction for each study. For consistency purposes, CUREE staff cross-checked particular aspects of the data extraction and keywording to ensure that the information was correct across all parts of the process, and made changes in agreement with the reviewers as required. The reviewers then agreed that the collated version was an accurate representation of their discussion before it was uploaded.

4.4 Nature of actual involvement of users in the review and its impact

Continued guidance from Review and Advisory Group members who were teachers or who worked closely with teachers enabled us to maintain a sharp focus on user perspectives. This was particularly the case in the initial stages (for example, developing the protocol) and final stages (for example, giving feedback on the draft final report). We learned from the previous two reviews that involving users (see section 2.1, for our definition of users) in the complex and time-consuming data-extraction process was problematic as well as beneficial. Teacher participation at this level is expensive and all training has to be duplicated and expenses met.
The Review Group agreed data extraction may be too difficult in terms of time (for example, developing an understanding of statistical terms and techniques) to engage teachers and other users who were inexperienced in research processes. But, as before, because we recognised the importance of a user perspective in the in-depth section of the review, we used CUREE staff who were recently practising primary and secondary teachers, or had experience in other education-related fields, to assist in the data extraction. As before, we also had the help of our first review Chair, Janet Sturgis, a retired and occasionally supply teacher, with recent research experience. And we were helped by an ex teacher member of the National College for School Leadership. This served to ensure that we had practitioner perspectives on the project activities at all times. In addition, members of the Review and Advisory Groups, including teachers, ex-teachers, ITT practitioners, policy-makers, academics and representatives of large teacher organisations (GTC and NUT) contributed to the progress of the review at regular Review and Advisory Group meetings. As in the first review, the mix between the practitioner perspective, information scientists and that of experienced academic researchers, including the EPPI-Centre support staff, contributed to the balance and rigour of the review process as they all brought different viewpoints, skills and experience to the table.
5 FINDINGS AND IMPLICATIONS

5.1 Summary of principal findings

5.1.1 Identification of studies

During the searches for our first and second reviews we sifted 18963 titles and abstracts systematically, reviewed 489 full text studies and identified 45 studies as relevant to the current review. These studies were then mapped as described in the next section.

5.1.2 Mapping of all included studies

Of the 45 studies included in the map, 31 were teacher and pupil impact studies from our first and second EPPI-Centre reviews of CPD while the remaining 14 came from the teacher only impact studies that had been excluded from the previous in-depth reviews. The majority of studies came from the USA. The educational settings in which the studies took place were predominately primary (N=29) and secondary (N=24) schools, while some settings covered both. Twenty of the primary schools studies focused on teacher and pupil data and nine on teacher only data. For secondary schools the numbers were twenty-one and three respectively. Nearly all studies with teacher only data also focused on teaching and learning (N=11), as did all of the studies with teacher and pupil data (N=31). The next most popular focus of all studies was curriculum (teacher only data N=9, teacher and pupil data N=24). Most studies with a curriculum focus featured predominately mathematics, literacy (first language) or science in both clusters of studies.

5.1.3 Synthesis of findings

The synthesis of findings in relation to the teacher only data studies was based on the eleven studies which were judged to have high or medium Weight of Evidence. In seven of the eleven studies the research aims primarily related to the evaluation of a particular CPD design or approach in the context of a curriculum-based goal. In four cases the CPD studies were directed mainly at the improvement of a particular aspect of the curriculum or teaching strategies, using the CPD as the vehicle for improvement. One study reported research which appeared to be targeted equally at the focus for improvement (literacy) and the CPD (peer coaching). In all cases but one the researchers provided data about the interventions which offered us the opportunity to:
(1) identify and report on the CPD processes and activities for the teacher only data studies and
(2) compare these across the two groups of studies: ie those which present teacher impact data and those which also present student impact data.

In nearly all cases the findings are reported across a range of teacher outcomes (see below) and the researchers draw conclusions about the CPD design in relation to these. We have categorised all outcomes in two broad clusters: affective and behavioural.

Because many of the CPD interventions involved a large number of different (albeit overlapping) components in combination, it isn’t possible to identify whether some
components are more important than others until studies start to unpack further their interventions. What we are able to do is identify which components recur in programmes with positive outcomes with what frequency.

5.1.3.1 Impact of the CPD in the teacher only studies

Impact on teacher behaviour:

Teaching
In all but one of the studies the teachers involved in the CPD interventions changed or substantially developed aspects of their teaching. The exception was a study which successfully promoted professional collaboration which influenced teachers’ professional (collegial) relationships and their approach to their own learning, but which reported no data about impact on teaching behaviours.

Developments in teaching practice covered a wide range:
- improving mathematics instruction by means of inquiry
- developing activity-based, inquiry-oriented science teaching
- implementing specific, research-based classroom interventions learner-centred approaches to teaching mathematics
- teaching process skills in primary science
- improving mathematics teaching through cognitive coaching
- implementing new instructional strategies
- improving literacy teaching in relation to a new framework for literacy teaching
- enhancing the quality of instruction for students with learning difficulties in the general classroom

Reflection and collaboration
Some of the studies emphasised commitment to continuing professional collaboration and reflection as an outcome as well as a CPD process. Evidence from the studies suggested that:

- collaborative, school-based action research, using case writing, enhanced teachers' understanding of students' learning and enhanced their reflective thinking about their teaching;
- cognitive coaching enhanced collaboration and reflection amongst the maths teacher participants;
- peer coaching encouraged collaboration and reflective discussion; and
- collaboration became part of teachers’ everyday practice, for example coming together at lunchtime to discuss their teaching.

Affective impact
All of the studies reported observable and self reported changes in at least one of the affective aspects of professional learning:
- Motivation;
- Confidence;
- Attitudes and beliefs

Specifically:
- two studies highlighted the motivating impact of the CPD intervention;
• four studies identified changes in teacher confidence as a direct outcome of the CPD intervention:
• one small scale, case-based study of inquiry-oriented maths teaching reported changes in teachers' attitudes and beliefs about what constitutes 'good' mathematics teaching;
• a large-scale controlled trial also found evidence of attitudinal change amongst the project teachers which encouraged them to be more reflective about their teaching; and
• in another study the CPD resulted in teachers changing their beliefs about assessment.

5.1.3.2 CPD processes and characteristics

The studies provided evidence about positive benefits of CPD that:
• made use of peer support;
• made explicit use of specialist expertise;
• made explicit mention of involving the teachers in applying and refining new knowledge and skills and experimenting with ways of integrating them in their day to day practice; six studies involved action research;
• involved consultation with the teachers, either about their own starting points, the focus of the CPD, the pace of the CPD or the scope of the CPD;
• involved teachers observing one another as an integral part of the CPD; and
• involved specialists in observation and reflection (as part of the CPD rather than exclusively focused on data collection).

5.1.2.3 Nature of collaboration

In the second review (Cordingley et al., 2005) we began to explore the nature of collaboration in more detail and developed some very tentative hypotheses about the nature of effective collaboration based on what we found out about the interventions. These were:
• within school, classroom-based CPD may be more effective than off-site CPD alone even if the latter involves teachers working together;
• collaboration between teachers which is focused around active experimentation may be more effective in changing practice than reflection and discussion about practice;
• collaboration may be an effective vehicle for securing teacher commitment and ownership of CPD in cases where it is not possible for the teachers to select a CPD focus of their choice; and
• paired or small group collaboration may have a greater impact on CPD outcomes than larger groups.

Our intention, as we stated in the report, was to test these propositions in the light of what we discovered about the nature of effective collaboration in relation to its impact on teachers and teaching but not on pupils. Therefore we interrogated the data from the group of studies in this review (which reported on teacher outcomes but not on student outcomes) as follows:

Where did collaboration take place?
In general the findings from the review are consistent with the proposition that CPD is effective when it has a significant in-school component.
What part did reflection and professional conversation play in relation to changing practice?
The majority of the studies combined reflection and experimentation with active classroom practice. This combination appeared to be effective in changing practice.

How many teachers at a time collaborated and what form did it take?
Teachers working in pairs was the most common combination although it was unclear in two of the studies what the unit of collaboration was. In some of the larger studies there were opportunities for collaboration in larger groups as well. In some studies teachers collaborated in different ways in different phases of the CPD. For example, in one study teachers’ starting points were reviewed during the first phase and a framework for evaluating children’s learning was developed. In phase two teachers planned, taught and observed each other in pairs in their own classrooms and in phase three teachers and their head teachers together evaluated the CPD.

Was the CPD voluntary or mandatory?
In all but two of the studies teachers were voluntary participants in the CPD intervention. However it seems clear from the researchers’ reports of affective impact that the collaborative processes involved in the CPD models, together with the new knowledge and understand experienced by the teachers were effective in motivating teachers and enabling them to take ownership.

Nature of collaboration
The frequency of these patterns and incidences across the studies do not constitute evidence of cause and effect. However they have increased our understanding of the nature of effective collaboration to the point where we feel confident about our four propositions. The majority of effective CPD models across the eleven studies we drew on for the synthesis exhibited the characteristics we had previously identified.

Did teachers refer to students’ gains?
There was very little evidence about teacher perceptions of the impact of CPD on pupil learning apart from a few passing references in some studies to ways in which the teachers were encouraged by perceived student responses to new ways of doing things. These references lacked sufficient detail to enable analysis.

5.1.2.4 How did the teacher studies compare with those reporting pupil data?
In the second phase of the synthesis we compared studies reporting teacher only data with those providing evidence about impact on students.

Specifically we explored the four areas:

- aims;
- nature of the interventions;
- outcomes;
- study design.

Aims
Whilst the two samples differed absolutely with regard to whether they set out to explore whether CPD programmes had an impact on pupil learning, there are some similarities in relation to their aims. A little over half of the samples in each group
aimed to explore the impact of a specific teacher development programme. Aims related to the impact on teaching and learning of introducing specific pedagogic strategies were a common feature of about half the studies in each cluster.

On the other hand the two samples are more distinctive in relation to other aims. Studies which focused on teacher impact only were more likely to have an explicit intention to develop teachers’ knowledge, understanding or skills and were much more likely to have an explicit aim to change teacher beliefs or attitudes.

We are not clear about the reason for these differences although it seems likely that the goal of changing pupil learning in the teacher and pupil sample may have stood as a proxy for evidence about these largely implicit phenomena in those studies. By contrast the teacher studies might have set out to provide direct evidence about these phenomena as a proxy for direct pupil data.

Almost all of the studies collected data about teacher knowledge, understanding and skills whether or not this was an explicit goal of the CPD programme.

**Nature of the interventions**
The key strategies used in the two samples are similar in relation to:
- the use of specialist expertise;
- observing others teach;
- peer support; and
- the use of workshops and seminars.

All these strategies feature prominently in both clusters of studies, but there was a much greater explicit emphasis on action research in teacher only studies.

It should be noted that whilst only a limited number of programmes are described as action research, the activities reported in many programmes as peer support or peer coaching bear similarities to those described as action research.

We have found nothing in this review to cause us to question the findings or conclusions about the processes and activities involved in effective CPD from the first two reviews of studies which looked at both teacher and pupil impact.

**Outcomes**
There are more differences in the outcomes between the two samples.
All the teacher only data studies focused upon affective outcomes compared with fewer than half of the studies reporting student impact data. It seems likely that the need to focus upon pupil outcomes has squeezed this aspect of learning lower down the priority list for the teacher and pupil sample.

Changes in teacher behaviour was an explicit outcome of the vast majority of studies with similar proportions in each cluster providing evidence.

**Study design**
All the studies were evaluations. About three-quarters of the teacher and pupil studies were researcher manipulated evaluations compared with roughly two-thirds of the teacher impact only type. The rest were naturally occurring evaluations.

Over twice as many teacher and pupil studies used control or comparison groups than did the teacher impact studies. We also noticed that teacher only studies were
much more likely to collect data during the study than were those reporting student outcomes.

A significant difference that we found between the two clusters was in the length of time during which the collaborative CPD took place. In studies which had both teacher and student impact data nearly all the studies took place in a year or less. However, in the current review of studies which did not collect or report on student impact none were less than a year and over half were conducted over a period greater than one year.

5.2 Strengths and limitations of this systematic review

*Strengths*
One strength of this review is the way it builds systematically and cumulatively on previous reviews. In doing so it has continued to probe the questions raised in previous reviews about the emphasis on impact and the exclusion of other types of evidence. Another strength is the way that the review grows from live concerns and consultation with policy-makers and practitioners through the involvement of a number of user groups in setting and refining the questions and interpreting the findings.

In particular the CPD Review Group considers that the review has continued to help in the following ways:

- developing a taxonomy of collaboration which is meaningful and applicable to practitioners and policy makers;
- adding to the base from which we can continue to unpack the specific processes involved in the CPD intervention and identify those which appear to influence change in teacher practice;
- exploring further the effect and influence which external and specialist expertise brings to design and impact of CPD processes; and
- identifying the patterns of research related to CPD and the relative strengths and weaknesses of studies that do and do not collect pupil outcomes data..

*Limitations*

- One limitation of the review was that we didn’t run any additional searches to see whether there were any other articles or reports covering student data for these programmes by the authors of the teacher only studies, although the descriptions of methods and approaches within the articles suggest this is unlikely to be the case.
- We were conscious throughout of the limitations of the data provided in the studies we retrieved in regard to answering our review question. None of the studies was designed to answer our review question directly.
- In particular, we noted problems arising from the compressed timetable. There were difficulties in responding to possible trends or patterns arising out of answers to the questions in our protocol by creating further tables. We were unable to go back to the original studies from the earlier reviews in the detail that we would have liked to follow up new points arising from the current review. For example we would have preferred to carry out a more detailed analysis of the outcomes for teachers.
- We also noted in the individual studies
  - a varying amount of detail about the sample in some of the studies, and some reviewers noted that they would have liked to have been given more detail...
about the sample background(s) in order to make the connections between contexts;
- a lack of detail, and in some cases, clarity, of the different aims and foci of the studies;
- the overwhelming majority of studies were conducted in the USA and so it is not known whether the findings could also apply in other countries;
- there may well have been additional fruitful data in a number of PhDs and other studies. However, we were unable to retrieve these within our timescale and note that these data remain unexplored;
- a lack of discussion, in some studies, of the effect of using the researchers as part of the CPD intervention on the evidence; and
- the small-scale nature of some of the studies included in the in-depth analysis.

5.3 Implications

5.3.1 Implications for Practitioners

The research suggests that collaborative CPD is linked with positive outcomes regarding teachers’ attitudes to working and reflecting collaboratively with colleagues on a sustained basis.

Schools and CPD co-ordinators working with colleagues who have little or no inclination to work with others should create and resource opportunities for teachers to participate in CPD in partnership with one or more colleagues.

In cases where teachers did not volunteer to take part in the CPD but were required to do so, the collaboration designed into the intervention helped to convert initial co-operation into genuine collaboration.

Schools and CPD leaders should pay attention to the potential benefits of collaboration when trying to meet the needs of disaffected or demotivated colleagues. Similarly, CPD co-ordinators should ensure that they use collaboration (eg in refining learning goals) as an important tool for teachers facing mandatory programmes – to develop ownership and personalise their learning.

Most of the effective CPD in the research included learning which took place in the teachers’ own schools and classrooms.

CPD leaders and teachers need to harness all available in-school opportunities for professional learning: for example through team teaching, and ensuring that lesson-planning takes place collaboratively and is structured to include opportunities for debriefing.

The positive outcomes reported in the studies in the review were linked to CPD interventions which combined reflection with active experimentation.

CPD leaders and head teachers should review CPD plans and opportunities to ensure that opportunities for professional dialogue are linked to opportunities to experiment with new approaches in order to root learning conversations in classroom evidence. Teachers should seek out such opportunities.

Collaborative CPD seems to be effective in more intimate settings.

School and CPD leaders and CPD providers might want to consider offering teachers opportunities for small group or paired work within any larger groupings.

There was little evidence about teachers' perceptions of the impact of the CPD on their pupils’ learning in the studies which focused only on impact on the teachers. But
studies that do contain pupil impact data highlight the way in which pupil impact motivates teachers to sustain their learning.

CPD leaders and programme managers should encourage teachers to articulate, record and reflect upon their perceptions about the impact of the CPD and related changes in classroom practice on their students’ learning.

The group of studies which focused solely on collecting teacher impact data were sustained over much longer periods than those which also collected student data. Yet an earlier review found that gains for the CPD were not necessarily greater for those lasting more than one term.

CPD leaders and heads should reflect regularly on the match between the distance to be travelled and the length of any CPD interventions whilst bearing in mind the benefits associated with CPD that lasts at least one term.

The review found congruence between the processes used in the CPD in both groups of studies, both of which also found positive outcomes for teachers as a result of these processes. This may suggest that these characteristics of CPD, in combination, could be used by school and CPD leaders, on an experimental basis, as proxy success indicators in weighing up whether to pursue certain CPD opportunities. Policymakers should encourage this on an experimental basis and trial its effectiveness.

The review found that studies which focused their aims on both teacher and student outcomes were more likely to have rooted their interventions in evidence about pedagogy. Conversely, studies which focused their aims on teacher impact were more likely to have been rooted in the literature about CPD and adult learning.

CPD providers and CPD school leaders should ensure that CPD programmes draw explicitly on both the relevant public knowledge bases about teaching and learning and about CPD.

5.3.3 Implications for Researchers

The aims of the studies in the groups differed markedly. In the group of studies which collected data on both pupils and teachers (N=26) only three specifically targeted affective outcomes from their interventions. In the other group of studies which collected data only on teacher impact, most (seven out of eleven) targeted such outcomes. Yet affective outcomes featured as incidental findings in many of the first group of studies.

Researchers exploring the impact of CPD on teaching and learning should consider collecting systematic evidence about the impact of CPD on affective aspects of teachers’ professional identity.

Studies of CPD which was linked to positive outcomes identified core elements of collaboration which recurred in combination. The specific effects of the individual components in isolation from each other were not explored.

Researchers exploring the impact of CPD should consider collecting data about the relative impact of these core elements, by treating the components as independent variables.

Studies which focused on teacher data were less comparative in their designs than studies which collected both teacher and student data.

While recognising that the control and comparison groups in the first group of studies comprised of students rather than teachers, we nevertheless believe that studies...
which focus on teachers need to place greater emphasis on collecting comparative data.

The group of studies which focused solely on collecting teacher impact data were sustained over much longer periods than those which also collected student data. *Future reviews should explore whether this difference is accounted for by the much greater emphasis on affective goals, or by the need for a short term focus in order to enable collection of data about outcomes for particular cohorts of students.*

The review found that the CPD featured in studies which focused their aims on both teacher and student outcomes was more likely to be rooted in evidence about pedagogy. Conversely, the CPD in studies which collected only teacher impact data was more likely to be rooted in the literature about CPD and adult learning. *In future, studies of CPD and the related interventions should incorporate and build equally upon the pedagogic and the CPD literature. In other words, studies that evaluate specific CPD programmes need to problematise the nature of the changes in pedagogic practice as well as the CPD processes. Similarly studies of the development of teaching and learning need to problematise the CPD processes and interventions and to collect and analyse data about them if they are to provide research users with the information they need to operationalise findings and recommendations.*

### 5.3.3 Implications for Policymakers

CPD is the vehicle through which all new policies must work if change is to become embedded rather than cosmetic. The cumulative picture of positive outcomes for teachers and pupils emerging from this review suggest that collaborative CPD between teachers has the potential to play a critical role in interpreting and embedding all policy initiatives in practice. The complex combinations of sustained peer and specialist support, of in-class experimentation coupled with protected space for reflection and structured dialogue and the role of collaboration in personalising goals, sustaining commitment and developing ownership are challenging. They sit at some distance from traditional conceptions of CPD and the current arrangements for organising and evaluating it in many schools. But they reinforce the emerging consensus about the nature of a proactive, modern profession within which teachers are seen as an important resource for each other in supporting and sustaining the development of their own and their colleagues’ practice. Policy makers should review both explicit and implicit assumptions about the ways in which new initiatives are implemented in schools and consider how these could be enhanced by an explicit commitment to sustained, collaborative CPD.
6. REFERENCES

6.1 Studies included in map and synthesis

6.1.1 Studies included in in-depth review and synthesis

The references below are for teacher data only studies which were included in the third review in the in-depth review and synthesis:

6.1.2 Teacher data only studies included in in-depth review but not in synthesis

These studies were excluded from this review for low weight of evidence

6.2 Teacher and pupil data studies included in the comparison

These teacher and pupil data studies came from the first and second reviews.

Appalachia Educational Laboratory (1994) *Questioning and understanding to improve learning and thinking (QUILT): the evaluation results. A proposal to the National Diffusion Network (NDN), documenting the effectiveness of the QUILT professional development program.* Post Office Box 1348, Charleston, West Virginia 25325-1348, USA.

### 6.2.1 Teacher and pupil data studies not included in the comparison

The studies by Flecknoe (2000) and O’Sullivan (2001) were excluded from the first review on low weight of evidence grounds. Pedroza (1998), Sandholtz (2001) and Schmitz (1994) were removed from the synthesis of the second review because of their low weight of evidence.

Searches which were specifically for collaborative CPD studies were carried out for the first review, and brought up to date in the second review to cover the years 1990-2003 inclusive. Searches specifically for individual CPD studies, and those which could have retrieved studies of both types of CPD were limited to the years 1992-2003 inclusive in the second review. Most of our search strings did not concentrate on curriculum. Although we had found from the first review that English or literacy and maths and science appeared particularly regularly in retrieved titles, these areas were not specifically searched on as they would appear anyway if they were related to CPD.

Teaching
APPENDIX 2.5: Definitions of CPD review-specific keywords

Type(s) of Intervention

Definitions for review specific CPD processes and characteristics

Action research
Use this keyword if the intervention was provided through systematic enquiry within the establishment which was designed to yield practical results that are applicable to a specific situation or problem.

Coaching: peer
Use this keyword if the intervention involves the provision of structured support and information by colleagues that is focused upon specific aspects of teaching and learning that have been agreed between the coach and coachee. The coach's job is to provide specific information that the coachee would not have access to if working alone, that is geared to agreed learning intentions and that sits with in an agreed framework of specialist expertise. Coaching, according to the findings of the first review, also involves providing a working context:
- where mutual professional trust enables colleagues to admit and learn from mistakes;
- that structures and sustains experimenting, and reviewing or refining practice towards goals over time.
Peer coaching is undertaken between teachers who agree to develop their professional learning through a mutual process of support and challenge.

Coaching: specialist
Use this keyword if the intervention involves coaching as defined above, but where the coaching is provided by external CPD providers.

External expertise
Use this keyword if the intervention involves the use of individuals or groups from outside of the school context to inform professional development activities with specialist knowledge or skills and programmes.

Internal expertise
Use this keyword if the intervention involves the use of specialist knowledge or skills from individuals or groups from inside of the school context to inform professional development activities and programmes.

Joint planning
Use this keyword where teachers are involved in collaborative activities related to any of the following:
- development of curriculum materials;
- learning activities; and/or
- learning objectives.

Mentoring
Use this keyword if the intervention involves the sustained support of a teacher in developing their practice by a more experienced and expert colleague. Usually includes observation and feedback/briefing, providing advice and information about new ideas across a broad spectrum of teaching and learning issues, plus providing learning support.

Observation: peers
Use this keyword if the intervention focuses on classroom observation involving teachers and their professional colleagues as part of their professional development.
**Observation: specialist**
Use this keyword if the intervention focuses on classroom observation carried out by outside specialists as part of the professional development process.

**Post Graduate Education**
Use this keyword if the intervention involves having received a post-graduate qualification, including qualifications at H and M level.

**Peer support**
Use this keyword if the intervention involves the provision of mutual assistance by pairs or groups of teachers involved in professional learning.

**Training**
Use this keyword if the intervention involves provision of information or materials on specific aspects of teaching/learning.

**Workshops**
Use this keyword if the intervention involves provision of information or materials provided through workshops with the aim of imparting knowledge which can be cascaded to various groups (e.g. students, teachers, governors, parents).
### APPENDIX 4.1.1: Consultation of teachers/participants and ownership

<table>
<thead>
<tr>
<th>Item</th>
<th>Leadership of the CPD. Were school leaders involved? LEA? HE experts? Teachers?</th>
<th>Were teachers actively involved in determining the pace and scope of their CPD?</th>
<th>Did the CPD address teachers’ individual learning needs and starting points?</th>
<th>Was there evidence of teacher ownership of the CPD in; a. choice of strategies, b. study aims/focus of mission, c. building on teachers' own knowledge, d. opportunities to discuss problems/challenges?</th>
</tr>
</thead>
</table>
| Farmer et al. (2003) | Unclear/Not stated  
A "teacher-leader" was involved, but there is no explanation of whether they were leading the CPD. | Yes  
Teachers took what they wanted, and or were able to take from the CPD sessions. The researchers created a model describing how teachers were interacting with the project in order to try to learn better what teachers were taking from it. | Yes  
The researchers treated participants as individuals, realising they would all interact differently in the project, and took this into account when analysing the impact of the project on teachers. | Yes in all of these as explained:  
"As the project progressed, it became clear that various participants had rather different ways of interacting with it, and hence, seemed to experience different effects from their participation. Some appeared to be mostly interested in obtaining specific activities for use in their classroom, or in receiving credit for their participation. Others were interested in enhancing their professional skills, and their understanding of the subject material. Still others seemed to be “turned on” to a different way of thinking about and doing mathematics, and eager to uncover implications for their students and classrooms. We began to create a model describing how teachers were interacting with the project, and tried to learn in greater depth what they were taking from it." p.339  
The model the researchers constructed showed that teachers had three levels of appropriation:  
1. Concrete activity and content  
2. Professional principles and understandings; attitudes and beliefs  
3. Teaching as inquiry. |
| Goodell et al. (2000) | Yes  
The CPD programme was an Ohio-wide one over a decade, so must, the reviewer infers, have involved the local authority, HE experts, and | Unclear/Not stated  
The size of the programme meant that it was determined centrally, not by individual teachers. | Unclear/Not stated | Unclear/Not stated  
Not stated |

</tr>
</tbody>
</table>
The teachers in this study were particularly interested in behavioral management issues. Accordingly, they tended to develop interventions aimed at reducing disruption or facilitating on-task behavior.

Cochran-Smith and Lytle (1990)' (p. 821).

The model of teacher research used in the present study was highly participatory and teacher-driven, thereby providing professional development of an active nature as suggested by Ross (1994) and Little (1984)' (p. 822).

'Following the model, teachers first brainstorm to identify instructional challenges that are relevant to them in the instruction and/or behavioral management of their students. Teachers then devise data-based methods with which to corroborate or refute their perception of these challenges. Following group discussion of the verified challenges and a brief review of the applicable literature, the teachers develop intervention studies in an attempt to remedy or positively impact student achievement, behavior, or other elements of the classroom that they have identified. ' (p. 826).

The teachers tended to develop interventions aimed at reducing disruption or facilitating on-task behaviour, which was a big issue in the school in this study.

The teachers and instructional assistants involved were able to direct the focus of the interventions that they developed through the teacher research in which they were involved. The model of professional development provided allowed them to focus on classroom issues which were of importance to them. The reviewer infers that this would allow them to build on their own knowledge and starting points.

However, the teachers appear to have had little involvement in selecting the overall choice of strategies to be used – this was already focused on teacher research.

strategic responsibility. strategic control, the teachers selected their own areas of interest. was the case as a major part of the cpd was based on the teachers identifying and pursuing their own needs within an overall school context established by the principal. administrators to have a sense of joint control over professional learning. This was realized when the teachers selected an individual area of interest to work on while the principal decided on a larger focus for the school each year. This sense of joint control was especially important for teachers in the beginning. As one teacher observed, it opened up a door for them to think about working on something individually interesting as well as meaningful." (p.355) and "Closely related to a shared sense of control was a desire to keep the project manageable. Ms. Fry was very careful not to overwhelm the teachers. She explained, "It's about taking what they've already got and adding other dimensions." Rather than besieging them all the time with new stuff, she encouraged them to focus on one area of interest and "use the portfolio as a way to bring new initiatives that make sense to them." (p.355)
## APPENDIX 4.1.2 Reflection / action / theory

<table>
<thead>
<tr>
<th>Item</th>
<th>Were there opportunities for professional reflection?</th>
<th>Were there opportunities to plan lessons, teaching materials or schemes of work within a learning framework? Was this collaborative?</th>
<th>Were there opportunities to learn from research and/or explore theory?</th>
<th>Was the CPD intervention application-based (doing it) and/or discursive/reflective (talking about it) or both?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Farmer et al. (2003)</td>
<td>This was encouraged during workshops and seminars, in oral or written form, and teachers were also encouraged to keep a reflective record in their own time too.</td>
<td>Teachers could take what they had learnt from the CPD sessions, but it appears that they planned lessons etc by themselves rather than collaboratively. No specific detail provided but it does state in the outline of the project sessions discussion of planning implementation activities.</td>
<td>The book, &quot;Communication in the classroom: The importance of good questioning.&quot; was given to participants in the project to learn about &quot;good questions&quot;. The researchers discussed explicitly with participants how they used Sullivan &amp; Clarke's (1991) procedure to create one of the maths tasks at a seminar.</td>
<td>Both. Teachers discussed and reflected in workshops and seminars. They also reflected on their teaching after individual lessons that they had done using what they had learnt in the workshops and seminars. Material for lesson plans was supplied in the workshops, but teachers were also expected to use the ideas rather than just concrete activities, in their classrooms.</td>
</tr>
<tr>
<td>Goodell et al. (2000)</td>
<td>Unclear/not stated</td>
<td>Unclear/Not stated The reviewer infers that, as the study background section attributes failure of many teacher professional development activities to factors including the lack of &quot;including time for reflection&quot;, that reflection time was built into the programme.</td>
<td>Unclear/Not stated The reviewer infers that such opportunities were built into the programme - and particularly the stress on e-mail support illustrates the emphasis on continuing collaboration.</td>
<td>There is no indication as to whether the research which grounded the whole programme was shared with the teachers. Yes it included both.</td>
</tr>
<tr>
<td>Greenwood and Haury (1995)</td>
<td>Teachers were able to reflect during their discussions in the afternoons at the Science Camp, after they had been putting their newly constructed ideas into practice.</td>
<td>Eight teachers worked together throughout the year on the Planning Group in order to prepare for the summer activities. During the summer activities for the students the Planning Group teachers</td>
<td>During the intensive Science Institute the teachers had the opportunity to explore inquiry-based learning. The reviewers inferred that this would include some theory as it was led by university people, one of whom had</td>
<td>Both, with an emphasis on 'doing it'.</td>

<td>---------</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Hawkes and Romiszowski (2001)</td>
<td>The key variable being measured was the amount of reflective dialogue that was taking place in computer mediated or face to face discourse. This implies that there was the opportunity for professional reflection to take place. Yes - in the larger project. Teacher teams completed and delivered their first problem-based learning (PBL) unit in the spring of the first project year. Teachers planned for refinements to the first PBL units and the development of a second unit through the summer. Collaboration was promoted through the use of the networks to communicate and share ideas with each other.</td>
<td>Unclear/Not stated there is no mention of any research that may have been introduced to the teachers involved. The intervention involved the creation and implementation of PBL units, but also reflection in face to face meetings and through CMC discourse.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Henson RK; (2001)</td>
<td>The approach actively engages teachers in a collaborative process to critically explore their own classroom contexts. Using a 'participatory research and development (PR&amp;D) model of teacher research the participants first identified instructional challenges that are relevant to them in the instruction and/or behavioural management of their students. After implementation of the studies, the teachers met and evaluated the effectiveness of their interventions. As part of the 'participatory research and development (PR&amp;D) model of teacher research, the participants collaborated in small groups to develop intervention studies in an attempt to remedy or positively impact student achievement, behaviour, or other elements of the classroom that they have identified.</td>
<td>The participants undertook a brief review of the relevant literature. No further details of such opportunities to learn from research and/or explore theory are provided. The CPD intervention included a balance of discursive/reflective activities and practical application-based activities: -six formal study team meetings (lasting 2-3 h each) -small group meetings as needed. Teachers then devise data-based methods with which to corroborate or refute their perception of challenges. -the teachers develop intervention studies in an attempt to remedy or positively impact student achievement, behaviour, or other elements of the classroom that they have identified.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Lin; (2002a)</td>
<td>This was a specific component of the research. The whole report is studded with instances of reflection. The teachers met together after observing each other's lessons to address issues and solve pedagogical problems. This lead to in-depth discussions.&quot;</td>
<td>There was a little evidence for this The researcher offered a theoretical account related to the distinction among various comparison type word problems. Both were critical elements of the cpd</td>

<tr>
<td>-----------</td>
<td>-------------</td>
<td>-----------------</td>
<td>--------------------------</td>
<td>-------------------------</td>
</tr>
<tr>
<td>Lloyd; (2002)</td>
<td>Professional reflection formed a considerable part of the professional development opportunity. Data collection for the research involved several self-reflective activities by the teacher-students.</td>
<td>Unclear/Not stated.</td>
<td>A considerable component of the programme of professional development involved the students undertaking their own action research on which they reflected. However, within the programme there was also opportunity to study theoretical perspectives relating to SEN as a disability issue; the politics of SEN; social construction and creation of SEN; SEN as an equal opportunities issue; and the whole integration/inclusion debate.</td>
<td>Essentially, the master's degree programme of study was discursive/reflective. It involved discussion of theoretical issues. The students actively engaged with action research which involved examining their own practice and exploring the impacts of changes that they introduced in the classroom. Hence, the professional development included both types of activities mentioned.</td>
</tr>
<tr>
<td>Lloyd et al. (2000)</td>
<td>Teachers were given the opportunity to reflect during work with their partner teachers. They were also given the opportunity to reflect after they had completed the three phases of the program.</td>
<td>The 15 coordinators and their partner teachers were given the opportunity to plan together, teach and observe each other in their own classrooms with a focus on process skills and to review the result.</td>
<td>Unclear/Not stated. It is not stated if the teachers were introduced to the theory on which the activities were based.</td>
<td>Yes - Both The intervention involved teachers identifying process skills in a baseline and end assessment. The teachers and coordinators worked together in schools to plan and teach using the knowledge and skill they had learnt and talked about this work together afterwards, reviewing the result. Teacher quote p363: “Through the course we had the chance to consider in detail the different process skills and what they involve. We have focussed on what to look for in the children’s work and contributions when different skills are being targeted.”</td>
</tr>
<tr>
<td>McLymont and Costa (1998)</td>
<td>Teachers met for PD sessions which included debriefing to share experiences, suggestions and reflections on their practice and what had been happening with the students. Co-coaching depended on collaboration and extended dialogue with colleagues and</td>
<td>Some. The coaching and co-coaching involved elements of joint planning and evaluation of practice.</td>
<td>Unclear/Not stated Not clear. The teachers were exposed to new techniques, but how much of this was simply directed by the researcher rather than allowing teachers to explore theory is unclear.</td>
<td>It seems to be both &quot;The coaching approach demands reflection on action and experience&quot; (p.17)</td>

<tr>
<td>Morin F; L; S; (1998)</td>
<td>There were opportunities in the meetings for staff to engage cooperatively in a reflective appraisal of instruction in the school. To aid self-reflection and analysis teachers kept written or audio logs. Teachers comment in the results and questionnaires that they appreciated the opportunity to clarify, reflect and collaborate. Teachers had the opportunity to help each other plan new curriculum and new ways of teaching. Strategies in Project Learn included: * team curriculum planning * testing new practices * teacher dialogue and sharing</td>
<td>The PD model used in this study incorporated presentations on PD days. Text resources and related readings. Steering Committees functioned like study groups. Readings were shared formally at workshops and planning meetings while specific readings were shared more informally with teachers. New professional resources related to Project Learn were placed in the Sherwood School library.</td>
<td>Yes - Both. The programme involved a mixture of meetings, discussions, seminars, planning, practical work, observations, peer support and collaboration. For example, “Teachers' abilities to link theoretical understandings about reforms with practice improves dramatically when they have the chance to apply theory in their own classrooms” (p.18)</td>
<td></td>
</tr>
<tr>
<td>Swafford et al. (1997)</td>
<td>This was a major component of the conferences.</td>
<td>Whilst there is no direct evidence of collaborative lesson planning the report refers to shared reflective thinking about their practice in a number of parts of the report. Teachers began to discuss the implementation of the literacy framework. They worked collaboratively to plan classroom management.</td>
<td>Unclear/Not stated</td>
<td>Both.</td>
</tr>
<tr>
<td>Turvey PJ; (1996)</td>
<td>Unclear/not stated</td>
<td>The teachers planned and wrote new curriculum units. They also worked together to identify strategies which would help towards inclusion.</td>
<td>In the first workshop the teachers were presented with two research papers to read.</td>
<td>The CPD seems predominantly discursive rather than practice based.</td>
</tr>
<tr>
<td>Vaughn et al. (1998)</td>
<td>The role of the teachers included &quot;to engage in ongoing reflection about the practices&quot; (p.60)</td>
<td>To some extent. The teachers worked with their special education colleagues to implement the strategies. The researchers acted as coaches by co-teaching the instructional practices and problem solving with teachers. This</td>
<td>To learn from research but not to explore theory</td>
<td>Both</td>
</tr>
</tbody>
</table>
Xu J. (2003) There are many references to reflection. Teachers reflected upon samples of student’s work which were kept in teaching portfolios. They reflected on the aims and activities in their teaching individually and collaboratively.

The study refers in several places to collaborative working, although these seemed to be casual/informal rather than a planned part of the CPD:

‘One teacher said, “It gives us something on paper to use and to share with others about our teaching styles and our ideas. It gives us a chance to talk to each other and to really collaborate.”’ (p. 353)

No

Unclear/not stated

It was more about reflection, but it did involve application too.
APPENDIX 4.1.3 Data collection methods and analysis

<td>Teacher support networks. Explicitly stated 'An ANOVA performed on the mean responses for each group of teachers' from their questionnaire answers. The numbers of correct answers were compared for the science knowledge surveys. And numbers of teachers becoming specialists/leaders in their schools was counted. p.156 Not stated/unclear: Very little is written about methods of analysis, especially for the discussions and interviews. Four quotations from teachers are included in the study. p.156</td>
</tr>
<tr>
<td>Hawkes and Romiszowski (2001)</td>
<td>Observation Other documentation: Data was collected by recording team meetings onto audio tape and copies of the computer mediated communication was also collected.</td>
<td>Analysis of the flow, frequency, and volume of communication activity and the nature of the dialogue, it centers on the reflective attributes of the discourse. All computer-mediated and face-to-face communications between project participants were scored on a seven-point reflection rubric. Low-level reflective responses are those which merely describe events and appear disconnected from the observer. More reflective responses richly describe events and attempt to explain them in light of theory or principle. To prepare the face-to-face discourse for analysis it was &quot;chunked&quot; into frames comparable to that of the electronic discourse. A team of three independent raters with doctoral degrees in education and a combined 40 years of experience in educational research participated in message rating training and calibration to ensure the reliability of the results. After all identifying information (school and individual) was removed from electronic messages and transcripts, raters judged each of the chunked exchanges in the face-to-face (n=222) and computer-mediated (n 79) messages using the seven-level rubric.</td>

<tr>
<td>2001</td>
<td><strong>Interviews and field notes</strong>&lt;br&gt;Each teacher was formally interviewed at the beginning and end of the project. The school principal, the two assistant principals, and two mentor teacher researchers were also interviewed. It is not explicitly stated who conducted these interviews, but the reviewer infers that they were conducted by the author/researchers. <strong>Observation</strong>&lt;br&gt;Process observations and field notes were made through the project. The reviewer infers that these observations and field notes were made by the author/researchers. <strong>Self-completion questionnaires:</strong>&lt;br&gt;- Teacher Efficacy Scale&lt;br&gt;- School Participant Empowerment Scale&lt;br&gt;- School-Level Environment Questionnaire&lt;br&gt;- Degree of project implementation&lt;br&gt;- Level of collaboration</td>
<td><strong>Qualitative analysis, data handling:</strong>&lt;br&gt;Typed transcripts of interviews were developed for analysis. Field notes were also submitted to qualitative analysis. <strong>Data analysis:</strong>&lt;br&gt;The author explicitly describes both the qualitative and quantitative data analysis methods used:&lt;br&gt;Data were examined for convergence on the three primary data sources: quantitative indices, qualitative interviews, and process observations and field notes. All surveys were submitted to item analysis and examined for score reliability. Repeated measures analyses were used to examine change in general and personal teaching efficacy, empowerment, collaboration, and perceptions of school climate from pre- to posttest. Gain scores for these variables were predicted by level of implementation to determine effects attributable to implementation of the teacher research projects. Regression analyses were also used to examine the relationships between the variables. Qualitative data (i.e. interviews and field notes) were submitted to a constant comparative analysis in which themes were allowed to emerge into meaningful categories. The data were grouped according to the categories and interpreted in light of the study's overall focus on teacher research and efficacy to provide a rich description of the experiences of participating teachers.</td>
</tr>
<tr>
<td>Lin; 2002a</td>
<td><strong>Group interview</strong>&lt;br&gt;One to one interview (face to face or by phone) <strong>Observation</strong>&lt;br&gt;Self-completion report or diary <strong>Coding is based on: Authors' description</strong></td>
<td><strong>Explicitly stated</strong>&lt;br&gt;Data were analysed using a grounded theory approach, as described by Strauss and Corbin. In this approach the research is the primary instrument of data collection and analysis, applying inductive methods and striving to derive meaning from the data. In keeping with this approach there were no predetermined criteria or coding system in the analysis. To document teachers growth of knowledge, the transcripts of interviews, group meetings and observations were analysed using a procedure in which all documents were reviewed and annotated. Each transcription was coded by the researcher and two graduate students. The results were reciprocally examined to see if the codes from paragraph to paragraph were consistent among the analysts.</td>

<td>One focus group at the end of the project. Group interview Extensive use of ongoing reflections and interactions during the seminar series and monthly professional development sessions video-taped and audio-taped. Open ended questions used. One to one interview (face to face or by phone) Face to face with individual teachers. Semi structured. 3 interviews in June, Oct and Dec. Started in June 1997 prior to the seminars. Observation Data collected on classroom observations, conversations and meetings and PDP sessions.</td>
</tr>
</tbody>
</table>
Morin F; L; S; (1998)  
Group interview  
Recording of small group discussions: small group discussion questions (Appendix)  
One to one interview (face to face or by phone)  
semi structured interviews were conducted and auto-recorded with all the teachers observed and the school principal  
Interview Recording Form (Appendix)  
Observation  
Observation Recording Forms (Appendix)  
Classroom observations and school tours were conducted twice during the first year of the two year study. These were documented via note taking, verbatim description of events and photography.  
Field notes  
Self-completion questionnaire  
Reaction forms (feedback forms to Professional Development Days):  
School/college records (e.g. attendance records etc)  
Minutes of meetings  
School newsletters  

Explicitly stated  
Data analysis was based upon analytic induction and the constant-comparative method, both suggested techniques for case studies using more than one data source. Data were reviewed, interpreted and coded as an ongoing process throughout the data collection period. Triangulation was used to help confirm the findings of the study.

Swafford et al. (1997)  
One to one interview (face to face or by phone)  
Research assistant interviewed each teacher on two occasions.  
Peer coaches also interviewed.  
The peer coach 'conferenced' with each teacher after each of the four types of cpd intervention.  
Observation  
Lesson observations to inform reflective papers and coaching conferences.  
Self-completion report or diary  
Reflective papers completed by teachers and peer coaches.  
Other documentation  
Some lessons were videotaped for discussion later. These interviews between the peer coach and the teacher were audiotaped then transcribed.

Explicitly stated (please specify)  
On page 418 the report stated:  
'Inductive data analysis (Bogdan and Biklen, 1982) procedures were used to analyze the data.  
Transcriptions of audiotaped data from interviews and peer coaching conferences, as well as copies of teacher reflection papers were read and re-read to get a sense of the data as a whole.  
Then notes were written to record initial impressions of topics that re-occurred in the data and to note the relevance to research questions.  
To code the data, segments were highlighted and tagged with a code and then stored on an electronic index card.  
During the initial coding process, data were sorted by codes and printed.  
Then the sorted data were examined and checked to make sure all data identified by a particular code were similar.  
When codes appeared to be related or to overlap, a more general code was used to identify the data. Conversely when codes were too broad, they were redefined and divided into subcodes.  
Codes were examined to determine how they were related and then sorted.

<td>Self-completion questionnaire</td>
<td>The participants prepared new curriculum units to support inclusion which were inspected by the researcher.</td>
<td>Implicit Numerical comparison of pre- and post-test scores which are given as percentages. The researcher read the new curriculum prepared by the teachers and compared their responses with her own checklist although this is not made available.</td>
</tr>
<tr>
<td>Vaughn et al. (1998)</td>
<td>One to one interview (face to face or by phone)</td>
<td>Five semi-structured interviews during the year-long period of the intervention.</td>
<td>Explicitly stated (please specify) Most of the data collected for this study were a result of field notes, interviews and observations. The first flow of analysis occurred during data collection and involved 2 activities (a) researcher transcribed tapes and notes, summarised transcriptions and field notes and brought their written materials to weekly meetings and (b) researchers met weekly to listen to reports and to discuss organisational frameworks and whether further data sources were needed. The researchers then carried out data reduction. The 2nd flow of analysis included the development of data summaries by 6 researchers. One researcher examined all the summaries and identified significant findings. The central findings were then subjected to individual re-examinations of data sources. The 3rd flow of analysis involved reviewing conclusions and subsequently verifying them. Conclusions were drawn over time and reported if they were found to be explicit and grounded.</td>
</tr>
<tr>
<td>Xu J; (2003)</td>
<td>One to one interview (face to face or by phone)</td>
<td>open-ended interviews were used twice over 8 months. All interviews were conducted at the school, and the data were collected on audiotape. The first interview was conducted at the beginning of the school year and was transcribed immediately. Other documentation Teaching portfolios were collected from all of the teachers. Other collected documents included students' work, the principal's letters to teachers relating to their portfolios, and teachers' written feedback to the principal. These documents were used to inform the development of interviews, particularly the second round of interviews.</td>
<td>Explicitly stated Data analysis was conducted simultaneously with data collection. Themes derived from preliminary analysis of the first round of interviews were used to inform the development of the second round of interviews conducted near the end of the school year. Analytical files were built after a school visit or during the transcription of an audiotape. During the final stage of analysis, the constant comparative method was used to analyze the data from various sources. Here data were analysed such that an existing item was replaced by a new one if it provided a better example to illustrate the category.</td>

</table>
| 2003  | Farmer et al. (2003)  The researchers wanted to know what was being accomplished in EMES, and what the participants were getting from it. The three aims were to find:  
• what an inquiry stance toward mathematics teaching looked like  
• how this stance developed  
• what the role of the EMES project was in its development? |
| 2000  | Goodell et al (2000)  The researchers wanted to describe the impact, on participating mathematics teachers, of those specific aspects of Project Discovery that concerned their views of mathematics, their pedagogy, and the involvement of their school principals and students' parents with their work as mathematics teachers. |
| 1995  | Greenwood and Haury (1995)  The broad aims were to:  
• provide 'experiential learning for teachers'; and  
• promote 'an inquiry oriented approach to science teaching'. |
| 2001  | Henson RK; (2001)  The study aims were to examine the motivational effects of a teacher research initiative that was implemented in an alternative and special education school. More specifically, the study investigated the self-efficacy, empowerment, collaboration, and perceptions of school climate of teachers who participated in teacher research. |
| 2002a | Lin; (2002a)  The goals of the research were:  
• to enhance the rethinking of mathematics teaching in classrooms in the spirit of the curriculum standards;  
• to foster teachers' awareness of children's learning;  
• to support teachers as they began to put into practice their new vision of a learner-centred approach to teaching mathematics; and  
• to promote teachers' ability to reflect on their teaching experiences.  
The study reported here was designed to examine the effects of constructing cases with a collaborative research team in order to develop knowledge central to teaching. |
<p>|    | Lloyd et al.  This article investigates the possibility of changing confidence about and understanding of the teaching of process skills in primary science. |</p>

</tbody>
</table>
| 1998  | Morin F; (1998)    | The purpose of the study was to "explore the effects of professional development experiences based on the theoretical model developed by Morin (1990, 1994) on teachers' abilities to implement planned educational change in the context of Sherwood School's Project Learn." (p.5). | Key questions identified features of planned educational change, including:  
  - What factors contributed to positive teacher change?  
  - What evidence can be provided to suggest the Project Learn is being successfully implemented in the school?  
  - What factors are inhibiting teachers from changing? |
| 1997  | Swafford et al.     | The purpose of this study is to examine teachers' and coaches' perspectives on the efficacy of peer coaching. |                                                                      |
| 1998  | Vaughn et al.       | The study aimed to build on previous knowledge and, through providing an intensive, collaborative professional development programme, measure the extent to which this programme encourages and enables teachers to include and enhance the quality of their instruction for students with learning difficulties in the general education classroom. |                                                                      |
| 2003  | Xu J (2003)         | This study aimed to better understand how a school used teaching portfolios as a primary mechanism supported by a set of conditions to promote professional learning and collaboration among teachers at different developmental stages, and to add to knowledge in this area. The two research questions were: What was the impact of the teaching portfolios on professional learning and collaboration? And What were the enabling conditions that helped foster school-centered professional development through this portfolio project? |                                                                      |
APPENDIX 4.2.2.2 CPD intervention and processes and activities

a) Teacher and pupil data studies

<table>
<thead>
<tr>
<th>Report</th>
<th>Intervention and type of collaboration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Appalachia (1994)</td>
<td>Seminars were held every four to five weeks to provide opportunities to: share successes and problems, review specific content, practice and apply specific skills and behaviours, plan for classroom use, plan work with a partner. In addition a subgroup of the participants from each of the three conditions were randomly sampled to be videotaped to provide further information on their use of and their students responses to the questioning strategies. Peer coaching, observation, peer support, seminars/workshops were also used.</td>
</tr>
<tr>
<td>Boudah et al (2003)</td>
<td>Teachers collaboratively defined instructional problem areas and targeted one strategy for training - the unit organiser routine. They then addressed on-site scheduling and other logistics for the planned training and classroom demonstrations. Next, teachers participated in 1.5-2 hours of on-site training and observed the trainer demonstrating implementation of the unit organiser routine in various content-area classrooms with students. They debriefed with the trainer about what they had learned and observed. During the following week or two, teachers planned their own implementation of the unit organiser routine. The trainer then observed teachers practicing the use of the instructional strategy in which they had been trained. In after-school meetings, the trainer provided group and individual feedback to teachers about their implementation. After several weeks, teachers met again with the trainer individually and in small groups to share successes, to troubleshoot problems and to create necessary instructional modifications. Additional follow up meetings were held at the beginning of the following school year.</td>
</tr>
<tr>
<td>Britt et al (1993)</td>
<td>The study was concerned with the impact of teacher conversations on teacher behaviour, beliefs and subject understanding as manifested through increased pupil achievement. Two-year programme when teachers met researchers each month and worked in groups of two or more in their schools. Researcher observed teachers and gave feedback</td>
</tr>
<tr>
<td>Britt et al (1991)</td>
<td>During each session there was an opportunity to consider various aspects of classroom teaching activities that project teachers or researchers presented. There were two main components: classroom observations by researchers - fed back to teachers with their notes added so that a summary of the main aspects of their teaching</td>
</tr>
</tbody>
</table>
Group sessions (8 in the first year and 10 in the second) of the project provided a forum for teachers to share their experiences during the project and also for further feedback from the researchers. In the second year of the project teachers began their personal projects to target the classroom changes they wished to make. There were also two full-day workshops on Cognitively Guided Instruction.

<p>| Brown DF (1992) | A consultant was engaged to work with teachers offering options of strategic interventions which were appearing in the current professional literature. The consultant outlined a number of options teachers could follow and worked with teachers in developing these options into practical and effective teaching strategies, with mutual support. The study looked at how teachers took up the opportunity; the effects of the programme on their beliefs and practices; effects on student beliefs and practices; changes in student academic and social behaviour; costs of implementing such a programme on a wider basis. |
| Bryant et al. (2001) | Four-month professional development programme for sixth grade middle school teachers and some special education teachers to enhance reading outcomes of struggling students in content area classes. Teachers’ professional knowledge of the following reading strategies was developed: word identification; fluency and comprehension skills. Implementation was monitored and findings of pupil progress and teacher perceptions of the effectiveness of each strategy reported. Each team consisted of a language, arts, science, social studies, mathematics and special education teacher. The teachers in each team shared planning and advisory periods and worked collaboratively to address their students’ needs. Implementation was monitored and findings of pupil progress and teacher perceptions of the effectiveness of each strategy reported. |
| Da Costa JL (1993) | All the teachers in this study implemented over one year, an approach to collaborative professional development based on a Local School District training course. The teachers were split into groups according to their specific plans for intervention. These groups included pairs of teachers working by collaborative consultation (peer-based using direct observation); collaborative consultation in a team teaching environment; collaborative consultation direct observation by a teaching partner; and collegial consultation of one teacher by a non-reciprocating supervisor. |
| Ertmer PA, Hruskocy C (1999) | The study describes the START programme which involved professional support, instructional support and technical support to teachers and students to enhance their own skills and confidence and help integrate technology in their classrooms. Support was provided through monthly meetings, technology inservice workshops and ‘on-call’ technical support from university personnel. Selected students also received training in an after-school technology programme. |
| Fine, JC; Kossak, SW (2002) | Simulations, planning and discussions based on the course materials containing rubric questions. The demonstrating “teacher” specifies what is to be observed and what data or observations are to be collected. During these cognitive coaching simulations, each graduate student rotated through a series of three roles (teacher, coach, and student). They also kept reflective journals and prepared videotapes of their application of the target strategy with their students. |
| Gersten R et al. (1995) | Two project staff with extensive experience in classroom consultation and special education teaching worked with two special educators in the process of coaching 12 classroom teachers. The special educator and project staff member usually began the coaching process by conducting classroom observations, focusing on several aspects of the students’ learning environments. As soon as possible after each observation, the special educator would share perceptions of the observed instructional interactions with the teacher, including, where possible, pupil data. Teachers and coaches repeated the weekly cycle of observation, feedback and planning for a period ranging from 3 to 30 weeks. |
| Harvey S (1999) | The intervention is concerned with the provision of effective INSET to teachers of primary science in South Africa by the Primary Science Project. A consultant outlined a number of options teachers could follow and worked with teachers in developing these options into practical and effective teaching strategies. The study looked at how teachers took up the opportunity; the effects of the programme on their beliefs and practices; effects on student beliefs and practices; changes in student academic and social behaviour. |
| Hanwell SH et al. | Learning environments research and constructivist learning environments. Action research as catalyst to improve professional practice within schools. |</p>

<tbody>
<tr>
<td>al. (2001)</td>
<td>aimed at enhancing use of technology in the classroom. A collaborative action-research effort between practicing teachers and university researchers was the focus for an investigation into the nature of the classroom learning environment prior to technology integration and after technology integration.</td>
</tr>
</tbody>
</table>
| Jacobsen, DM (2001)| Joint planning for the term ahead; but collaboration was mostly one to one rather than workshops and seminars. The intervention was carried out in classes who:  
- Worked with teachers, both individually and in teams across all grade levels to plan instruction and to plan demonstrations for the community and the press, and to organise celebrations of student work;  
- Modelled pedagogical methods with children to enable the teacher to be a participant observer;  
- Worked with technology support staff in the school and at the district level as advocates and leaders;  
- Observed and worked alongside teachers using new methods and discussed the results with them afterwards;  
- Worked with teachers to design appropriate assessment of student work;  
- Gathered, organised and shared resources with teachers and students;  
- Led professional conversations to build and extend teachers understanding of fundamental teaching and learning issues; and
- Provided scholarly and intellectual mentorship. |
<p>| Kimmel H et al. (1999) | The programme was designed to bring general and special education teachers together for collaborative participation in professional growth activities. Teachers were given access to appropriate instructional materials, educational technologies and hands-on experiences. As well as workshops during the academic year, teachers were invited to summer ‘practicum’ experiences. Built into the programme were opportunities to work collaboratively, at seminars and in workshops, with regular opportunities for reflection, and discussion of alternative practices together with observation and feedback of the implementation process. |
| Kirkwood M (2001)  | Teachers collaborated on a wide variety of development evaluation and dissemination activities in a variety of forums, such as regular planning meetings, workshops, reciprocal visits to exchange ideas and observation, small working groups and writing teams, preparing INSET sessions and presentations at conferences. |
| Kohler FW et al. (1999) | The study explores the impact of peer coaching by teachers on attempts to enhance pupils’ learning through pair activities developed within the Integrated Instructed Approach (IIA) Framework. The three teachers received half a day of instruction, then met during the course of the study for mutual observation and discussion. |
| Lin, SW (2002b)    | The CPD began with activities designed to help both the researcher and participant teachers to reflect systematically on their existing practice. The teachers then worked together to generate teaching schemes and trial them in their classes. |
| Martin, DS et al (2001) | Teacher cohorts in London and Dalian were involved in cognitive skill training. Training sessions of 3 hours each say for each cohort occurred over a three day period for a total of 9 hours of teacher training. Training sequences began with a theoretical overview of critical and creative thinking skills, followed by a discussion of some recent theoretical topics in the field, including multiple intelligences, divergent thinking, cognitive modifiability, metacognition, and the role of the teacher as cognitive mediator. The sessions continued with the demonstration of particular critical thinking activities. Activities in the training sessions involved teachers in discussing and solving sample problems, generating classroom activity ideas, working with partners and small groups as well as individually on problem tasks, and reflection on the metacognitive aspects of their activities. |
| McCutchen, D et al (2002) | The researchers held a two-week training session, involving day-long interactions between teachers and a team of university researchers, which they followed up with classroom observation and three successive training sessions during the academic year of the study. They reconvened for three follow-up sessions to discuss implementation, address emergent issues, and review topics requested by teachers. |</p>

<tr>
<th>Author(s)</th>
<th>Summary</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parke HM, Coble CR (1997)</td>
<td>The teachers collaborated with university science education specialists in the design of a new curriculum based on teaching strategies which incorporated: ideas from research, students' learning needs, the way students learn, understanding rather than content. Emphasis was placed upon the ability of teachers to design curriculum and classroom environments collaboratively.</td>
</tr>
<tr>
<td>Ross J et al. (1999)</td>
<td>The effect on teachers’ practice – and hence on pupil learning – of collaborative action research supported by academic involvement. The approach of this study was to build on teachers’ prior observation of other teachers to develop through action-research improved strategies for their own practice in promoting student self-evaluation during group learning activities.</td>
</tr>
<tr>
<td>Saxe GB et al. (2001)</td>
<td>The study compared three interventions: two initiated by the researchers and one in current practice. Group 1 worked on implementation of the Integrated Mathematics Assessment (IMA) which gave teachers the opportunity to work with other professionals concerned with effective implementation of reform. A five-day summer institute was followed by fortnightly meetings during the school year focused on the four sets of activities. Group 2 The Support Programme (SUPP) provided opportunities for collaborative exploration of how to implement the two new curriculum units. Teachers met nine times a year, sharing approaches, curriculum materials and discussing students’ work. Group 3 Traditional Classrooms with no professional development activity.</td>
</tr>
<tr>
<td>Shapiro, ES et al (1999)</td>
<td>Intervention strategies teaching observation, discussion and sharing practice, Lecture presentation, Videotape demonstration, and discussion and interaction with the presenter and other project staff. The 2½ day inservice consisted of both didactic and experiential components. Teams were instructed in four specific intervention strategies: self-management, social skills and problem-solving training, peer tutoring, and cooperative learning. Each training day was divided into two parts; during the morning, the teams were assigned to classrooms where they actively participated and observed teachers implementing the four strategies. Teams then met with Centennial staff to discuss and share teaching strategies.</td>
</tr>
<tr>
<td>Wilkins CW (1997)</td>
<td>The researcher trained one teacher specialist in each of two schools in the strategies and teaching techniques. The specialist then taught colleagues in these techniques and gave them prepared units of instruction. The teacher specialists practised with the units and used the information gained to prepare a second unit. Each resident specialist used regularly scheduled staff development sessions in the local school to train fellow teachers in performance instruction and assessment.</td>
</tr>
<tr>
<td>Zetlin, AG et al (1998)</td>
<td>Approximately 10 hours of professional development to develop awareness of (a) the theories underlying a developmental language arts approach and (b) effective instructional practices for implementation of a comprehensive language arts programme. Researchers met for one to three hours with teacher pairs to facilitate and support their classroom reorganisation. Collaborative discussions took place as to benefits/disadvantages of various classroom arrangements. Weekly professional development meetings with a researcher present were held throughout the school year for teachers and faculty to observe and discuss new strategies and curricula being implemented, and to resolve problems as they arose. Teachers implemented elements of the program at their own pace. Aspects of the CPD included: • visitations to schools where model developmental primary programmes were successfully operating, and participating classrooms were turned into demonstration sites at each school so teachers could alternate weekly meetings to observe and discuss new strategies, curricula and technologies being integrated into their instructional programmes. • peer teams were developed as collegial supports to facilitate integrating new knowledge, behaviours, and materials into their daily teaching repertoires and to share knowledge and resources of comprehensive language arts programme with other teachers at their school sites, and • mentoring support of peer teams by university faculty was ongoing.</td>
</tr>

### b) Teacher only data studies

<table>
<thead>
<tr>
<th>Item</th>
<th><strong>Intervention and type of collaboration</strong></th>
</tr>
</thead>
</table>
| Farmer et al. (2003) | It incorporated;  
• finding what teachers knew and building on it  
• specialist input including modelling mathematics pedagogy  
• professional dialogue and shared reflection  
• collaborative working among teachers  
• classroom observation and feedback.  
The CPD took place over two one week summer institutes, regular Saturday sessions held during the academic year and observations in schools. |
| Goodell et al. (2000) | The intervention on which this study reported involved:  
• six-week summer institutes for mathematics and science teachers conducted by outside specialists who modelled practice  
• six one-day workshops  
• ongoing profession collaboration with experienced teacher peers  
• ongoing collaboration via an electronic network |
| Greenwood and Haury (1995) | Phase 1: involved teachers working with specialists to plan summer CPD activities and went on throughout the year  
Phase 2: during a 1-week Science Institute the teachers acquired new knowledge and skills in science and teaching through specialist input  
Phase 3: was a 1-week summer Science Camp for students taught by the teachers who applied their new knowledge and skills, and worked with peers in planning and leading the activities |
| Henson RK; (2001) | The intervention was a university-school collaborative effort. It was a highly participatory and teacher-driven research project implemented in an alternative school for students with severe learning/emotional disabilities. Their practical action research involved:  
• reviewing research literature,  
• collaborating with other teachers,  
• reflective investigation  
• critical evaluation of their own practice  
• developing intervention strategies  
There were: six formal study team meetings (lasting 2–3 h each) and small group meetings as needed, facilitated by two mentor teacher researchers. |
| Lin; (2002a) | The intervention focused on developing cases to guide teacher learning and education.  
This three-year research project involved an action-oriented approach which aimed to help teachers examine their classroom practice by:  
• sharing classroom experiences |
<table>
<thead>
<tr>
<th>Source</th>
<th>Description</th>
</tr>
</thead>
</table>
| Lloyd et al. (2000)            | The intervention was related to teacher understanding of process skills in science and had three phases:  
• activities were designed to explore teachers’ understanding and confidence in process science  
• the 15 coordinators and their partner teachers collaborated in planning together, teaching and observing each other in their own classroom  
• teachers attended an evaluation session to see how their understanding and confidence had changed. |
| McLymont and Costa (1998)      | Teachers worked together with a researcher to improve maths results through:  
• seminars,  
• monthly professional development meetings,  
• weekly coaching session and  
• reciprocal coaching dyads  
The researcher served as coach for each teacher in the initial stage then as co-coach as coaching dyads took on the roles of coach and coachee. There was specialist input in the form of information about principles of coaching. |
| Morin F; L; S; (1998)          | The intervention incorporated:  
• professional learning,  
• individual and collaborative reflection,  
• specialist input,  
• collaborative planning e.g. new curriculum units  
• classroom-based experimentation,  
• ongoing feedback.  
It involved weekly meetings seminars at which teachers collaborated in small groups to plan and reflect together. The researchers also introduced research literature. There was modelling by outside experts. Teachers took part in observation. |
| Swafford et al. (1997)         | The intervention comprised peer coaching coupled with literacy teaching strategies to bring about improvements in teachers’ behaviour. The literacy strategies were introduced by experts at the start of the intervention. The strategies were reinforced by weekly meetings.  
The peer coaching involved  
• observation and feedback  
• collaborative reflection |
| Vaughn et al. (1998)           | The intervention was based on a researcher-teacher professional development group working to include selected students with disabilities in mainstream. The project involved classroom based activities and meetings.  
It incorporated:  
• building on teachers’ current knowledge and understanding  
• coaching,  
• in class demonstration lessons |
| Xu J; (2003) | In this intervention teachers kept portfolios of samples of students work for one academic year. During this year the teachers engaged in:  
|             | • professional learning  
|             | • collaboration with colleagues including the school’s principal and staff developer provided guidance and strategic leadership.  
|             | • collaboration and support in a professional community of other teachers and professionals |
### APPENDIX 4.2.2.3: Literature bases (all reviews)

#### a) Teacher and pupil data studies

<table>
<thead>
<tr>
<th>Item</th>
<th>Was the study informed by, or linked to, an existing body of empirical and/or theoretical research?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Anderson V; (1992)</td>
<td>Explicitly stated. This study builds upon a pilot study. The present project was influenced by research on reciprocal teaching, strategy explanation, student self-questioning, and expert reading strategies. More directly it grows out of an ongoing research on text processing and intentional learning. Other research cited related to: the distinction between students’ approaching learning as work to be finished versus approaching learning as a goal to be achieved through problem solving; intrinsic versus extrinsic motivation and task involvement.</td>
</tr>
<tr>
<td>Appalachi a Education al Laboratory (1994)</td>
<td>Implicit. The paper explicitly lays out the foundations of the QUILT programme including the questioning framework and the CPD framework. Implicitly the study is linked to these.</td>
</tr>
<tr>
<td>Boudah et al. (2003)</td>
<td>Explicitly stated. The authors construct their research on what is known about: 1. content enhancement instructional strategies; 2. critical barriers to accessing teacher friendly research reports; 3. poor match between teacher needs and in-service topics and instructional formats.</td>
</tr>
<tr>
<td>Britt et al (2001)</td>
<td>Explicitly stated. The study drew on previous research about:  - professional development programs for teaching mathematics which led to change in teachers' beliefs and classroom practices.  - improving teaching by developing teachers' knowledge of students' mathematical concepts and by encouraging teachers to reflect on the effects of different aspects of their teaching.  - teachers negotiating their own changes in classroom practice, with ongoing support from researchers and colleagues.  - the effect of discussions on content and pedagogical content knowledge on classroom practice  - the relationship between teacher's beliefs and the process of pedagogical change  - the relationship between teachers' knowledge and their ability to teach.  - the integration of mathematical knowledge, as demonstrated by the connections teachers saw between the different areas of mathematics.  - collegial factors and professional growth</td>
</tr>
<tr>
<td>Britt et al (1993)</td>
<td>Explicitly stated. 4 reports published in the 1980s highlighting weaknesses in students' achievement: The researchers discussed research about problem-solving which reformers in New Zealand and elsewhere regarded as a central strategy for improving</td>
</tr>
</tbody>
</table>
For example:

The researchers also highlighted research which informed the cpd element of the study including:

- teacher awareness of students' difficulties
- social constructivism
- teachers' of subject matter and how students learn
- creating a problem-solving environment
- models of teacher change

Brown DF (1992) Explicitly stated. The report was extensively informed by worldwide empirical and theoretical research, which provided a rich contextual background for the study and is explored in detail. Specifically the study was informed by literature on effective schools, reflective teachers and the increasing influence of cognitive/ developmental psychology applied to the classroom.'

Bryant et al (2001) Explicitly stated. The study referred to extensively cited previous research in the field of reading and comprehension of content based texts. This previous research highlighted:

- reading text fluently,
- possessing word identification strategies
- use context clues to comprehend the meaning of each discipline's vocabulary and
- using text structures to gain meaning from text.

Previous studies had also shown that many middle school teachers do not feel prepared to meet the needs of their struggling readers.

Costa JL (1993) Explicitly stated. Their model of teacher growth suggests that teacher consultation can lead to teacher growth, which in turn can effect teacher efficacy and hence further teacher growth. They provide a logical framework for considering under what conditions such activities are likely to occur. The building blocks they identify relate to:

- teacher trust for their collaborator,
- the supportive beliefs of a teacher's collaborative as opposed to prescriptive advice or feedback.
- teacher reflection and its relationship with efficacy.
- teacher classroom behaviour.
- the key role of the coaching relationship, is the factor in influencing student achievement, attitudes and behaviour.

Ertmer PA; Hruskocy C (1999) Explicitly stated. The researchers cite a range of evidence which identifies problems in teachers’ using teachnology in their classrooms including:

- limited equipment, training, and support.
- teachers' current pedagogical beliefs and their resistance to change

This research concludes that a range of types of support are necessary including: administrative, emotional, instructional, technical and professional

Fine, JC, Kossak, Explicitly stated. The research highlights features supporting teacher learning including

- transforming ideas from one form to another.

<tr>
<td>SW (2002)</td>
<td></td>
<td>• processing critical elements of instructional strategies through analysis and reflection. Cognitive Coaching was identified as a positive process in encouraging analytical reflection.</td>
<td></td>
</tr>
<tr>
<td>Harvey S (1999)</td>
<td></td>
<td>The study was informed by research on the importance of coaching as a classroom support strategy. Theoretically, it was informed by two developments of a social constructivist view of adult learning which has its roots in the work of Vygotsky: namely, ‘activity theory’ which extended Vygotskian concepts to adult professional learning, and Rogoff's theory of situated learning. The model of classroom support used in the study was based on Joyce and Showers' synthesis of research into the characteristics of INSET and the efficacy of coaching in particular.</td>
<td></td>
</tr>
<tr>
<td>Jacobsen, DM (2001)</td>
<td></td>
<td>The study is informed by provincial politics including legislation surrounding the study of computer technology and teaching quality standard. It is also influenced by technological and educational reform and factors that limit technology integration, and provides an overview of approaches to ICT professional development and innovations research. Situated in research about the diffusions of innovations.</td>
<td></td>
</tr>
<tr>
<td>Kimmel H et al (1999)</td>
<td></td>
<td>The authors cited previous research which critiqued previous professional development including: 1) Programs are not provided within the context in which the skills and knowledge are used 2. Programs are not focused on teacher behaviour in classrooms 3) Programs are not responsive to the complex array of teacher behaviours that constitute standards based practice 4) Programs do not consider all factors affecting teacher behaviour, belief, perceptions, beliefs etc 5) Evaluation of programs focuses only on the outcomes of the training for teachers and does not include teacher practice.</td>
<td></td>
</tr>
<tr>
<td>Kohler FW et al (1999)</td>
<td></td>
<td>There is discussion of research regarding both peer coaching and paired peer assisted teaching of students.</td>
<td></td>
</tr>
<tr>
<td>Lin, SW (2002b)</td>
<td></td>
<td>Research cited explored constructivism and a teaching format called the 5 E model. This model suggested a teaching sequence which was engagement- exploration- explanation- elaboration- evaluation. It also provided charts that would help teachers identify their own and student behaviours that supported or contradicted the various phases of the instructional model.</td>
<td></td>
</tr>
</tbody>
</table>
Furthermore, individuals' existing conceptions influence the meanings that they construct in a given situation, and what is learned results from an interaction between the learner's existing conceptions and the various linguistic and sensory experiences provided. Designing teaching schemes to support science learning requires:

- an appreciation of the prior knowledge that students are likely to bring with them to the learning situation,
- a recognition that individual learners make sense of learning experiences in personal ways,
- learners assume both the power and responsibility to take control of their own learning.

<table>
<thead>
<tr>
<th>Source</th>
<th>Explicitly stated. The study builds on previous research studying cognitive performance in deaf people and learning styles. In particular it draws on the effects of instrumental enrichment as a learner strategy. The study developed from a body of research on deaf learners. The literature referred to moves from a time in the early 20th century when research suggested that deaf children had inferior intelligence, through a gradual series of papers that found that deaf children performed as well as hearing pupils in a variety of tasks. In 1986, one of the authors conducted a study in the USA on the effects of intervention using materials adapted from the Instrumental Enrichment program for deaf students. The present study extends the research in the area of spatial and reading skills.</th>

<tr>
<td>Shapiro, ES et al (1999)</td>
<td></td>
</tr>
</tbody>
</table>
have reported consistently that general education teachers for the most part feel they lack preparedness to teach these students and suggest that a specific set of knowledge and skills are necessary for general education teachers if they are to be successful in working with students with EBD.

The study also draws on other research highlighting effective strategies including class-wide peer tutoring, cooperative learning, reciprocal peer tutoring, self-management, social skills training and problem-solving training.

Previous research identifies the need for collaborative and intensive consultation between general and special education teachers.

| Zetlin, AG et al (1998) | Explicitly stated. The report is accompanied by a short literature review that considers approaches to staff development including specifically ongoing collegial support. It also examines teachers' theories and beliefs about student learning, and the creation of collaborations between universities and schools. |

**b) Teacher data only studies**

| Farmer et al. (2003) | Explicitly stated. The study is informed by a preliminary impact study carried out on the same project, and also additional empirical work. Theoretical perspectives are also considered and together these are put together to form a conceptual framework (a reflective model of mathematics professional development) that guides the description and analysis of the observations. Previous research cited in the study refers to:  

- how to support practicing teachers in implementing reforms  
- experimenting to discover what can "work"  
- sustaining impact by addressing explicitly teachers' fundamental dispositions and beliefs about the teaching and learning of mathematics  
- what makes good questioning  
- knowledge construction  

| Goodell et al. (2000) | Explicitly stated. "The Landscape study was initiated to evaluate how this model of professional development has affected the teaching of mathematics and science in middle schools in Ohio. The study is informed by the implementation of the Ohio Statewide Systemic Initiative (SSI) (known as Project Discovery). The background also draws on research that has considered reasons for the failure of professional development programmes to bring about long term change. Explicitly the chapter states that it builds on earlier evaluative research suggesting that project discovery teachers made considerable changes to their teaching practices after their participation in the SSI and that these changes were sustained over time. It also complements previous research demonstrating that the mathematics performance of students in SSI groups was significantly higher than that of their non SSI counter parts across all racial and gender groups. |
| Greenwood and Haury (1995) | Explicitly stated. The researchers referred to a number of other researchers who had commented on the 'low incidence of inquiry-oriented science teaching in elementary schools'  
References:  
For the CPD the study drew on research about  
- peer support and coaching and  
- follow up support which offered teachers the opportunity to try out what they had learned (Lombard Konick and Schultz (1985)).  
References  
|---|---|
| Henson RK; (2001) | Explicitly stated. The study was informed by a wide range of prior research.  
In the first instance, literature which outlined the rationale for the study, and its background context:  
- the participation of schools and districts in the facilitation of professionalism.  
- teacher professional development in which teachers assume control of classroom decisions and actively participate in their own instructional improvement on an ongoing basis  
- participatory teacher research as one means of fostering meaningful professional development for teachers including collaboration in which teachers themselves critically examine their classrooms, develop and implement educational interventions, and evaluate the effectiveness of those interventions  
- teacher self-efficacy as a mechanism that has consistently been linked with both positive teacher behavior and student achievement  
- the opportunity for teachers to increase decision-making capacity and autonomy (Boudah and Short & Rinehart (1992b)).  
Secondly, literature which underpinned the concepts addressed by the study are described.  
- the description and classification of teacher research agendas based on roles of participants, focus of the research, and outcomes intended by the process. 82  
- practical action research  
- collaboration between university and teacher researchers which can serve to reduce the perceived tension between the worlds of research and practice.  
- teacher experimentation  
- study design  
- teacher efficacy  
The literature reviewed in the study forms an extensive and detailed survey of all these items. |
| Lin; (2002a) | Explicitly stated. The study is informed by empirical research relating to teacher education and in particular the creation of narratives or cases as an alternative method of teacher education. It is also informed by a theoretical framework of teachers learning to teach including reflection, cognitive conflict and social |
Interaction. This includes work of Piaget and Vygotsky.

Other research cited suggested that cases used in teacher education may teach more effectively than traditional expository approaches to teaching since cases reflect real situations and pose problems, issues, and challenges for teachers and are vehicles for establishing a dialogic model of connecting theory and practice. Cases had been used by teachers to (1) develop knowledge of a particular theory or build new theories, (2) practice analysis and assimilate different perspectives; and (3) stimulate personal reflection.

The use of cases in teacher education includes both case discussion and case writing. Case discussion can play a critical role in expanding and deepening pedagogical content knowledge and fostering personal reflection through an external process. Cases constructed by a collaborative team consisting of various backgrounds and experiences for sharing multiple perspectives and comments are more likely to provide enriching exemplars.

The body of research reported in the literature review is primarily concerned with professional development, including:

- classroom teachers' growth
- weakness of existing pd work such as one-shot workshops, training without technical assistance or follow-up, top-down plans, courses unrelated to classroom experiences, diffusion of products, lack of attention to teacher perceived needs.

### APPENDIX 4.2.2.4: Findings of the studies

#### a) Teacher and pupil data studies

<table>
<thead>
<tr>
<th>Report</th>
<th>Findings and conclusions</th>
</tr>
</thead>
</table>
| Anderson V; (1992)                          | Experimental teachers and their students changed substantially from pre to post test, while control teachers and students remained stable.  
- Experimental teachers showed an increase in problem solving incidents whereas controls overall showed a loss;  
- Significant increase in student talk, and a decrease in teacher talk;  
- Increased student participation seemed to increase teachers' tendencies towards overly exuberant praise and repetition of student responses.  
- Only the reading comprehension subtest showed that significantly more experimental students made gains than the control group.  
The strongest teachers either were peer taught by heads or by teachers in their own schools.  Teachers who were weaker had done substantially fewer sessions than any of the experimental or control teachers due to staffing and time constraints or had no peer support and little administrative support. |
| Appalachia Educational Laboratory (1994)    | Teachers in all three conditions significantly increased their knowledge and understanding of the research base regarding effective classroom questioning, although the effect size for Condition A was greater than for those in Conditions B and C.  
Condition A teachers showed significant positive changes to their use of these behaviours:  
- decreased the number of questions asked;  
- significantly increased their use of wait time;  
- an increase in questions posed at cognitive levels above recall;  
- increased the use of one question to more than one student;  
- increased their use of the student designated after question procedure; and  
- significantly decreased their repetitions of student responses.  
Almost 10% more student answers to condition A trained teachers' questions were at a higher cognitive level following the intervention. |
| Boudah et al. (2003)                        | Most teachers who participated in the APD training implemented the unit organiser routine in which they had been trained, whereas not all teachers who participated in traditional in-service training implemented did so.  
Overall student engagement rates and in-class assignments had improved as a result of using the unit organiser routine.  Some teachers thought that overall test scores had been affected by use of the strategy.  Most responses to the TEQ were positive and supportive of the APD model.  Teachers were enthusiastic about the opportunity to observe classroom modelling of unit organiser implementation as a part of the training.  The hands-on involvement of the trainer in "real classroom environments with "real students" was cited most often as an APD model asset.  In addition teachers liked the convenience of participating in the training during the school day and not having the burden of preparing for a substitute teacher. |
| Britt et al. (2001)                         | All teachers believed they had made marked changes. Changes in practice included: greater focus on the plenary session; less emphasis on "telling"; use of students own problems as a teaching point. Teachers showed more insight into students' thinking. Students' mathematical performance showed improvement.  
Secondary teachers made the greatest changes, but this could have been because the intermediate teachers were already using a student-centred approach and so there was less room for change. More experienced teachers were significantly more likely to affirm beliefs consistent with reform orientated pedagogy. |
| Britt et al. (1993)                         | Teachers indicated that they had changed their approach to teaching maths during the time of the project. They had been using some of the ideas and practices explored in the project in maths lessons. Teachers had changed towards a more constructivist approach to teaching maths. In particular, they placed greater emphasis on students exploring mathematical ideas amongst themselves and less emphasis on teacher-centred instruction. The results suggest that those most likely to benefit from this project were secondary teachers, and experienced teachers. Overall, the mean attitudes of students in |
project classes were higher than the means for the attitudes of Form 3 students in the IEA sample (original respondents of the questionnaire).

Brown DF (1992) Teachers were enthusiastic, valued opportunities to develop new skills through collaborative working. They adopted strategies to suit their classes. High use of co-operative learning, advance organisers and graphic transformations. Students demonstrated increased ability in the use of learning strategies as well as academic progress. They felt better prepared for exams and more confident. Report concluded that this style of programme is highly successful in improving student performance and highly satisfying to both teachers and students.

Bryant et al. (2001) Teachers were concerned about their struggling readers and valued the CPD in terms of time to share personal knowledge, receiving guidance from an expert and opportunity to work collaboratively with their colleagues. Teachers developed knowledge of and skills in implementing word identification, partner reading and collaborative strategic reading. The CPD resulted in improvements in low-achieving students’ decoding skills and reading fluency. Concluded that teaming was an effective model for CPD in this context, but time was a major issue.

Costa JL (1993) Teachers with a belief in personal efficacy were more likely to be teaching pupils with higher levels of attainment, but these pupils sometimes had negative attitudes towards school. Teachers with a belief in general efficacy were more likely to change their behaviour in response to CPD. Teachers that used CPD involving classroom observation were more likely to effect changes to enhance pupil attainment. Students of these teachers generally had positive attitudes to school. Teachers using a supervisory model of CPD without classroom observation and feedback, were significantly less able to make changes.

Ertmer PA, Hruskocy C (1999) CPD had a positive impact on teachers confidence and attitude towards technology. Teachers used computers more for their own professional use and for instructional purposes, but needed more time to fully integrate technology into their curriculum planning. Some student trainers were able to serve as effective training resources for the teachers. The ‘at risk’ students who were part of the training group excelled, showing increased self confidence and esteem. Concluded that CPD had initiated some important changes, but further research needed to examine whether this could be sustained.

Fine, JC, Kossak, SW (2002) It would appear that the use of rubric embedded Cognitive Coaching can initiate insightful change and professional development in college classrooms. The key appears to be teacher ownership of the process and immediate, practical application of the process in their classrooms. Colleague-to-colleague Cognitive Coaching using rubrics, encouraging feedback relative to student gains, and guided self-reflection can cause significant change in teachers’ dispositions toward professional development.

The combination of teaching a variety of expository text strategies while “repeatedly teaching a single strategy with some depth resulted in significant increases in student comprehension performance and change in teachers” attitude. When professional transformations are made transparent through collegial discussions, Cognitive Peer Coaching with rubrics paired with an objective assessment of the effects of their applications on student performance (DRP), teachers’ beliefs about their empowerment to improve instruction and student performance can be dramatically altered.

Gersten R et al. (1995) The process of change in teachers’ practice was slow and irregular although there was evidence of more instructional time spent on specific reading strategies as the project continued. Teachers experienced some anxiety in the process of observation and feedback, but about half of them reported more positive feelings at the end of the project. Beginning teachers had special needs and needed extra mentoring. Lack of time sometimes limited communication and therefore understanding between researchers and teachers. Students were able to read more fluently, demonstrated greater understanding of subject content and were better motivated.

Harvey S (1999) PSP teachers were more focused in their aims, more versatile in their approaches, more responsive to pupils’ contributions and more able to plan relevant lessons. Teachers who had participated in both classroom support and workshops were more ready to change their practice. Teachers valued counselling on contextual implementation of new methods and curriculum content, advice on specific problems and modelling of new techniques. Pupils were more likely to learn through self-activity and contributed more to lessons. Report concluded that effective INSET needs to offer an appropriate social context for the collaborative testing, validation and adoption of new teaching methods.

Harwell SH et al. Engagement in action research led to reflective practice and acted as a powerful catalyst for educational change. Teachers showed greater competence and confidence in both in technology use and the constructivist viewpoint of teaching and learning. Commitment to
<table>
<thead>
<tr>
<th>(2001)</th>
<th>Jacobsen, DM (2001) Instead of being a controlling and dispensing information, using a stand and deliver lecture format based on information transfer, the teacher became more of a facilitator, guide and co-learner and co-investigator. Tasks were designed to be authentic and engaging and built on students’ interests, ideas and active questioning rather than dispensed as photocopied sets of present questions for students to fill in. When presented with opportunities to explore and enquire into essential questions and enduring ideas that were meaningful to them, students’ work exceeded expectations for level and quality of scholarship. Student engagement was sustained and at higher levels of thinking and reasoning. Teachers implemented both fundamentally different teaching and learning strategies and also integrated new technologies with the support of the GN teachers. Many teachers admitted that they would not have pushed themselves and their students as far without the onsite access to sustained professional dialogue, pedagogical and technological support and reassurance of GN teachers.</th>
</tr>
</thead>
<tbody>
<tr>
<td>(2001)</td>
<td>Kimmel H et al. (1999) The greatest improvement in planning for, and teaching, special needs pupils within general education classrooms was noted in those teachers who had been involved for longest in the programme. Direct and successful work with special needs children served to enhance teacher efficacy. Modelling was seen as an effective means of support. Teachers needed help to bridge the gap between an understanding of the adaptations needed for SEN students and putting those needs into practice. Students showed more enthusiasm, participated more in lessons and their test scores increased. Greater logical thinking and organisation of work enhanced the quality of students’ work.</td>
</tr>
<tr>
<td>(2001)</td>
<td>Kirkwood M (2001) Collaborative approach led to cross-fertilisation of ideas, promoted effective use of time, supported honest and open discussions. Leadership in driving project forward was also shared. The new curriculum units ensured appropriate pace, offered opportunities for problem-solving in technology and allowed students greater independence. Students were motivated by the new units, reporting that they enjoyed working at their own pace and felt confident. The report concluded that the three main aims for teacher learning – engaging in disciplined enquiry, experimenting within an agreed framework and sharing expertise – were clearly met.</td>
</tr>
<tr>
<td>(1999)</td>
<td>Kohler FW et al. (1999) Results indicated that coaching produced two changes in teachers’ methods. First, both teachers increased their use of suggestions, prompts and questions to facilitate students’ interaction with their peers. The second coaching phase enabled teachers to adapt teaching materials, skills or social interaction roles according to their students needs. These changes were sustained during a maintenance phase. Pupils increased their levels of social interaction and talk. The report concluded that reciprocal peer coaching was a viable method of individualised instruction, but that further more extensive research was needed to investigate the effect of coaching.</td>
</tr>
<tr>
<td>(2002b)</td>
<td>Lin, SW (2002b) There were three groups of factors that seem to influence teacher development: personal factors, intervention factors and contextual factors. These three factors interact in a complex manner, affecting each other and in turn influencing teacher development. Students found science easier and more enjoyable. In general, the participant teachers showed positive attitude toward the new approach. In addition, the insights offered by research provided teachers with a rationale for thinking about teaching and learning. It was the first time for the teachers since their initial teacher training that they had looked at practice from a reflective and theoretical stance. The opportunity to be involved in the experiment was valued by all interviewed students and they were able to take a more active role in the construction of the practical experiments.</td>
</tr>
<tr>
<td>(2001)</td>
<td>Martin DS, Craft A, Sheng, ZN - Greater use of critical and creative thinking habits was observed by teachers with a significant difference in favour of the experimental group for the critical thinking problem; - Systematic focus on thinking strategies led to improved reasoning skills;</td>
</tr>
<tr>

<td>---------------</td>
</tr>
</tbody>
</table>
| 2001   | McCutchen D et al. | - Chinese teachers carried out the instruction in a more sequenced and invariant approach than the English, who adapted the activities to specific children and their characteristics;  
- Teachers in experimental classes in both countries increased their use of higher level questioning in classroom discussions;  
- Student attentiveness in the classroom increased in both countries;  
- Experimental students began to use cognitive vocabulary on a regular basis in the classroom and appeared to take others view points during the discussions more easily than prior to the study; and  
- Students improved their ability to explain a problem in their own words.  
Teachers’ phonological knowledge deepened after instruction, and they spent significantly more time on activities directed toward phonological awareness than control group teachers. Experimental group teachers were more explicit than control teachers in some aspects of literacy instruction. Although all teachers spent considerable time on orthographic activities, no significant differences across conditions emerged.  
- Phonological awareness increased in relation to teacher's use of strategies;  
- The experimental group gained an average 50% more in letter production than children in control classrooms.  
- Listening comprehension grew, but there was no significant difference in starting point or growth between experimental and control classrooms.  
- Students in the experimental group did not perform statistically differently in word reading to those in the control group.  
- Phonological awareness increased 36% on average  
- Orthographic fluency - no significant effect  
- Reading comprehension increased 60% on average  
- Reading vocabulary increased 29% on average  
- Spelling increased 37% on average  
- Composition fluency increased 100% on average  
Collaborative CPD promoted mutually informed conversations, clarification of core values and commitment to the ongoing process of reflection. Teachers designed assessments to provide feedback on pupils understanding. Project teachers were more process-orientated than content-orientated in their planning in comparison with teachers in control schools. Students in project schools were better motivated and were given more opportunities to work collaboratively. They also participated more actively in both practical activities and lesson discussions. These students covered less of the curriculum, but achieved the same results as those in the control schools. The report concluded that teachers were helped to become architects for change by building on their current concepts instead of trying to remediate them.  
Participation in CPD led to greater self-efficacy for teachers. The exemplary teachers while confident in collaborative learning techniques were less confident about methods of student evaluation. Professional conversations were valued in reassuring teachers about areas of mutual concern. Data provided evidence that teachers were able to improve their evaluation of students. Repeated feedback on their effectiveness fuelled increased aspirations. Students supported the changes that their teachers made. They believed that self-evaluation was fairer and appreciated having an opportunity to state their case to the teacher. The report supported this two-step approach to action research, one in which teacher researchers first learn how to study practice with academic support and then use the results to design their own action research.  
Every classroom, regardless of intervention, showed gains on the conceptual and computational scales. The reform programme when supported by IMA programme proved effective and was associated with greater student achievement on the conceptual items. However, there was no significant difference |
between computational scores of students in the IMA and TRAD classrooms. Achievement on the computational scale was greater for students who had received traditional teaching than for students who were part of the teacher support programme (SUPP). The study concludes that the use of reform curricula when implemented with focused support for teachers may lead to gains in students’ conceptual understanding.

**Shapiro, ES et al (1999)**

Substantial increases over time were reported for cooperative learning, peer tutoring and social skills training. Students who experienced the self-management improved their ratings, though the procedure was found less effective when reinforcers were not motivating enough and when teachers did not have sufficient support. Experimental groups showed significant differences in their knowledge of the intervention strategies at post test in comparison to the control group. Teams felt that self-management, cooperative learning, and problem solving training was effective. Peer tutoring was considered effective by everyone. Teachers felt that the intervention had changed their attitudes and were more comfortable and less afraid of including students. They had a more positive view of inclusion, and were more willing to try it with EBD students. Follow up data showed that many students were still included at the same or greater level of inclusion as previously. Districts reported using the interventions with other students and generally rated the intervention as effective or very effective. Transfer to teachers outside the project was reported and many districts also reported using a least one other intervention presented at the in service training.

**Wilkins CW (1997)**

Teachers reported an increase in their enthusiasm for teaching, an improvement in their teaching skills and an increase in their feelings of confidence. All the teachers viewed the use of portfolios and journals as beneficial practice in mathematics instruction and planned to continue using these assessment techniques. All schools demonstrated improved scores from first to second year in the project. Project school students had higher scores in graphing and computation. However, scores were not significantly different in problem-solving in the rural project and non-project schools. All schools showed a decrease for scores in measurement.

**Zetlin, AG et al (1998)**

Three emergent themes were identified: professional behaviour, student performance, and barriers to professional development: Professional behaviour:
- Teachers emphasised the increase in collegial interaction and formation of peer teams;
- Increased time devoted to individualised reading and writing due to the shift to centre based activities; and
- Advances in understanding of learning processes as well as a growing awareness of a variety of approaches and materials for language arts instruction. Student behaviour and learning:
- Students with few skills who were significantly behind peers, benefited from the individual conferencing in writing and reading centres and showed tremendous growth;
- Students who were reluctant to read or write at the start of the year due to very low ability, became "enthusiastic regulars" in the writing and library centres once they began experiencing success. Teachers found students enjoyed instruction and took responsibility for learning;
- Students gained confidence, developed skills for relating to peers, and really blossomed as leaders in the centre based environment; and
- Students exhibiting behaviours that would have led to retention or referral to special education in the past, thrived in the restructured classrooms. Barriers to progress were identified at district, school, process, and University level.

### b) Teacher data only studies

**Farmer et al. (2003)**

The findings included evidence of improved teacher motivation (“Donna found that ‘When I let go of my dependency on the text and began moving towards these other approaches, I finally felt comfortable and excited to teach math.’”) There was also evidence drawn from individual teachers’ comments that teachers had developed their practice.
| Goodell et al. (2000) | The study described demonstrated significant differences between programme and non programme teachers in terms of their views of mathematics and their pedagogy… they were much more concerned with issues about ‘How I teach’ and ‘What my students do’ than non programme teachers. Programme teachers also thought more about ‘My views about mathematics’. There was also evidence that teachers changed their beliefs. For example, all teachers who were interviewed said that the professional development they had participated in through their involvement with SSI had caused them to change their teaching practices and the way they thought about teaching. The study also provided evidence about supporting factors: the professional development experience itself, the willingness to find creative ways to overcome lack of resources, and the establishment and maintenance of teacher networks. Without these three aspects, it is doubtful whether SSI teachers would have been empowered to sustain the changes they made to their teaching beyond 1 or 2 years after their participation in the summer institutes. |
| Greenwood and Haury (1995) | The study reported that teachers changed in the following ways: 
- Teachers were more motivated (“I learned an approach for teaching science that I could use in my classroom while having the opportunity to work with other teachers.”) 
- SEPAL teachers were significantly more positive in their preferences for teaching science than teachers who had not been through the programme. 
- the teachers were more confident about teaching science and about participating in peer teaching, presenting inservice science workshops and providing assistance and feedback to preservice elementary teachers as they taught science lessons. In some cases they took on posts of responsibility for science teaching in their own schools-teachers’ beliefs changed and they were willing to accept that’s it’s all right not to know the answers 
- the teachers had better content knowledge than their non-SEPAL peers, although the gains were modest- the main gains were in relation to improved pedagogical content knowledge. |
| Henson RK; (2001) | This study reported that: 
- teachers worked more collaboratively—there was an increase in teacher efficacy 
- teachers felt more in control of their development 
The findings also showed that: 
- the observed gains (in efficacy and in collaboration) were not due to varying levels of project implementation. 
- collaboration was consistently related to general teaching efficacy improvement but not to personal teaching efficacy. 
- teachers who were not experienced in collaboration gained the most during the project. 
- quantitative measures of empowerment and teacher perceptions of school climate were not consistently related to efficacy. |
| Lin; (2002a) | The study found that: 
--the teachers learned about students’ mistakes so deepening their pedagogical understanding. The study found that the use of cases enhanced teachers’ understanding of students’ learning and improved their reflective thinking of teaching when cases were constructed consistently by a collaborative research team, with a university professor and same-grade teachers. |
Lloyd et al. (2000) Teachers’ understanding of process skills had improved The results of the baseline audit of teachers’ understanding of the process skills and the end of course repeat of this assessment provide evidence that teachers had significantly improved in their ability to identify and target process skills and felt able to use this in planning lessons. Whilst teachers’ confidence fell by the end of the CPD this arose from their greater understanding of what they had to do to teach process skills effectively to their students.

McLymon and Costa (1998) Teachers changed in a number of ways including:

- becoming more reflective (‘It is listening. It is questioning. It is paraphrasing. It is a creative process…and a facilitator of decisions.’)
- increasing their understanding of mathematics teaching and learning and they were able to allow for a greater range of outcomes.
- collaborated more
- moving towards building a learning community
- learning new approaches away from direct teaching methods and telling and showing students and instead allowing the students to learn by understanding for themselves the concepts they need to learn.

Morin F; L; S; (1998) The findings included:

- teacher changed beliefs towards assessment as a cyclical process – not an end or a linear process.
- teachers changed their practice in a number of ways including an increased focus on Maths assessment and evaluation, and increased integration of different types of assessment into daily practice, increased sharing and collaboration, adopting new teaching strategies such as interdisciplinary curriculum, developing community, authoring circles, no teacher desk, student-prepared newsletter, inquiry, writer’s notebooks, portfolios, involving parents, performance tasks.

- teacher talk reflected: a) changes in beliefs about learning; b) more talk about teaching and learning; and c) more sophisticated talk about teaching and learning.

The study also identified a range of supporting factors helpful to producing teacher change including:

* shared vision for school change
* professional collaboration and camaraderie
* administrative and financial support
* links outside of the school
* weekly school planning meetings
* teacher driven in-services with follow up and links to curriculum
* team curriculum planning
* opportunities for testing new practices
* opportunities for teacher dialogue and sharing
* related teacher resources.
<table>
<thead>
<tr>
<th>Swafford et al. (1997)</th>
<th>Findings showed that teachers changed in a number of ways:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- all teachers became more adept at implementing the early literacy lesson framework. They could explain how they implement the different components, when they use them, and the materials they use. Their integration of the framework improved and they can explain why they teach the way they do.</td>
</tr>
<tr>
<td></td>
<td>- teachers learned new classroom management skills such as managing guided reading instruction, centers, and other components of the framework simultaneously. teachers worked together to solve this problem. They used &quot;work boards&quot; to direct student learning activities in learning centers. This management tool enabled teachers to meet with small groups for direct reading instruction while other students were involved in meaningful literacy activities in centers.</td>
</tr>
<tr>
<td></td>
<td>- teachers also experienced affective changes - After a year, they were all more confident about the methods they use, their understanding of why the methods are powerful, and the decisions they make.</td>
</tr>
<tr>
<td></td>
<td>- teachers also made reflective changes. As they had more time to experiment with the framework and interact with coaches and other teachers, they became more reflective. Procedural concerns became less prominent in their peer teaching conferences, and teachers began to reflect more on their practice. Teachers began to discuss and write about implementation as a process that continues as they reflect individually, with their peers, and with their coaches.</td>
</tr>
<tr>
<td></td>
<td>Many of the conclusions relate to the coaching process:</td>
</tr>
<tr>
<td></td>
<td>- the study expanded the research base about peer coaching because it examines its effectiveness from the teachers’ and the coaches’ perspectives.'</td>
</tr>
<tr>
<td></td>
<td>- it showed that a coach can provide the procedural and affective support teachers need when they take risks to implement new methods which may be different from those they have used in the past. A coach can help teachers focus on their strengths and help them reflectively analyse their teaching and students learning. The benefits of peer coaching make it an important element of staff development programmes in which teacher change is the goal, without it being evaluative.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Vaughn et al. (1998)</th>
<th>Evidence showed that:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>- teachers were very positive about the programme - &quot;unusually so&quot;. They wanted to continue the program into the following year.</td>
</tr>
<tr>
<td></td>
<td>- the teachers learned new teaching strategies such as the Writing Process approach, Classwide Peer Tutoring and Making Words on a regular basis, and all</td>
</tr>
<tr>
<td></td>
<td>- the teachers adopted skills needed to organize their class into small groups of students so that students could work purposefully with each other.</td>

<td>Brown DF (1992)</td>
<td>Cb. Evaluation: Researcher-manipulated</td>
<td>Before and after</td>
<td>Each week teachers reviewed student progress in the light of diary entries, students' work or test results. The study was designed to explore how use of specific teaching strategies effected the attitudes and practices of students and teachers. The researchers were keen to note whether such interventions would raise the standard of learning for the 'lower achievers' in each class. Training in specific strategies of intervention, based on current literature and the work of previous researchers was offered to each of the participating teachers, who then chose options that they wanted to explore with their students. Teachers met with consultants once a week to receive coaching and discuss findings.</td>
</tr>
<tr>
<td>Bryant et al (2001)</td>
<td>Cb. Evaluation: Researcher-manipulated</td>
<td>Before and after</td>
<td>Pre and posttest data was collected on both students and teachers. The study focused on ten sixth grade teachers and their pupils, who were noted to be struggling to decode and comprehend written texts in a wide range of subjects. The researchers sought to evaluate current teaching practice in terms of personal knowledge about the teaching of reading in content areas, the teaching of reading strategies, and their perceptions of struggling students. All of the ten teachers in the programme received training in three specific reading strategies over a period of four months. The researchers then evaluated each of the three strategies in terms of how teachers perceived them as manageable working tools in their classrooms and how effective they were in terms of pupil achievement.</td>

two points during the school year. The first phase of data collection took place during October and early November of 1991, the data from this phase are referred to in this study as the "pre-measures". The second phase of data collection took place during May of 1992, the data from this phase are referred to here as the "post-measures".' (P.16) Teacher data was also analysed statistically to identify links within and between groups of characteristics (models of collaboration, teacher efficacy, teacher behaviour and pupil behaviour, attainment and attitude) in order to test and establish linkages between these factors. Teachers were allocated into different groups in accordance with the results of questions about their intended approach to collaboration in response to prior training. Assessment of the four categories were arrived at inductively. Data collection took place one month after the start of the school year and one month before the end. Data were collected in relation both to teachers and pupils. There was no researcher intervention.

| Ertmer PA;Hrusko cy C (1999) | Cb. Evaluation: Researcher-manipulated | Before and after The types and uses made of computers by teachers and student-trainers were measured before and after the interventions in the fall of 1996. | The project START was proposed as a collaborative professional development school effort between the university and Midland school. The main purpose of the project was to support teachers' technology integration efforts at the school. Instructional and technical training sessions were planned for both teachers and students. In addition university personnel provided ongoing professional support to address changing needs. The report states: 'We used qualitative methods to examine changes in teachers', students' and the school's use of technology. We examined teachers' and students' uses at the beginning of the year...and we examined technology use at the end of the year to document the types of changes (if any) that occurred.' |
| Fine, JC, Kossak, SW (2002) | Cb. Evaluation: Researcher-manipulated | Before and after Pre- and post-test scores on the Degrees of Reading Power in the 18 classes. (p34). Teachers were interviewed 'at first' and 'in time' after Cognitive Coaching | Two groups (experimental and control) were assessed in aspects of reading. The experimental group was given a precise method of working ("rubric") and the progress of the pupils measured against various variables. This method of working is defined as Cognitive Peer Coaching where teachers have to learn a technique and actively coach other teachers. The professional learning conversations is the method for providing understanding and ownership. |
| Gersten R et al (1995) | Ca. Evaluation: Naturally occurring | Other (please specify) Observed improvements in student performance were presented in feedback to teachers throughout the study as an integral part of the coaching process, in addition to informing qualitative evaluation at the end of the study. | This was an action research project in which researchers trained 2 special educators who then worked with 12 class teachers in the skills of effective teaching. The special educators provided specific and constructive feedback to the teachers. The outcomes were evaluated in terms of change in teachers' practice. |
| Harvey S (1999) | Cb. Evaluation: Researcher-manipulated | Before and after | The study was designed to assess the "value added" by coaching in terms of observable changes in teachers' classroom practice. Three hypotheses were framed for testing: |
1. Teachers that have participated in PSP INSET use different methods to those that have not.
2. Teachers change methods more readily if they participate in workshops only.
3. Changes in teaching methods are sustainable after support is withdrawn.

It is an observational study with a quasi-experimental design, cross-referenced with a number of ethnographic instruments among which are interviews and diaries. Hypothesis 1 was tested by comparing methods used by PSP teachers with a control group of non PSP teachers. Hypothesis 2 was tested by comparing each phase 2 teacher's performance before and after support. Phase 3 teachers who had workshops only were compared with teachers who had both workshops and support during the same period. The control group was compared with teachers who had both workshops and support. The control group was compared with teachers who had workshops only.

Hypothesis 3 was tested by comparing the performance of phase 1 teachers as they completed classroom support with their performance 14 months later.

whose teachers received researcher devised training in teaching higher-level critical and creative cognitive strategies, then compares the outcomes in England and China. Therefore it is a researcher-manipulated evaluation. minutes each time. Pre and post observations and tests were taken, and comparisons were made between countries, and with a control group whose teachers did not receive training. Additional comparisons were made in England between Deaf and Hearing students but these showed no differences so the scores were aggregated.

While the study does not provide much detail of the study design, this does not suggest that there is bias built in to it. It seems to fulfil the requirements of a random controlled trial.

this test was administered, were collected. Scores from the 1995-1996 school year test administration represented gains in scores due to state and county staff development sessions. Scores from the 1996-1997 school year test administration were analysed to determine the significance of a resident mathematics specialist in the school. Control, 312 treatment suburban. Simple analysis of variance using 1995 mean scores as a covariate revealed mean score differences in both treatment schools were statistically significantly higher in graphing and computation. Mean score differences in the rural schools were not statistically different in problem solving. All schools showed a statistically significant decrease in mean scores in measurement.

| Zetlin, AG et al (1998) | Cb. Evaluation: Researcher-manipulated | Before and after | Schools and teachers were invited to participate in a comprehensive language arts programme designed for "at risk" children. All teachers taking part received the intervention, and measurements of instructional practices, effectiveness were taken before and after the implementation. Further observations were taken throughout the implementation period (1 year) and interviews were carried out at the end. The proposed plan of action, contained the following components:
- approximately 10 hours of professional development to develop awareness of (a) the theories underlying a developmental integrated language arts approach and (b) effective instructional practices for implementation of a comprehensive language arts program.
- visitations to other school sites where model developmental primary programs are successfully operating.
- transformation of participating classrooms into demonstration sites at each school so teachers could alternate weekly meetings to observe and discuss new strategies, curricula and technologies being integrated into their instructional programs. Weekly meetings would (a) include demonstration lessons by university faculty of teacher-requested topics (i.e., how to do an integrated reading lesson, how to do individual writing conferencing, how to monitor growth in writing samples); and (b) serve as a mechanism for substantive collegial interaction where teachers could share issues, concerns, and ideas as they proceeded with changes in their instructional practices.
- development of peer teams as collegial supports to facilitate integrating new knowledge, behaviors, and materials into their daily teaching repertoires and to share knowledge and resources of comprehensive language arts programs with other teachers at their school sites. |
 ongoing mentoring support of peer teams by university faculty to support implementation of the elements of the comprehensive language arts program into classroom routines.

### Henson RK; (2001)

**Ca. Evaluation:** Naturally occurring  
**Before and after**  
**The teacher participants undertook an action research project over one academic year in which they developed interventions designed to reduce disruptive behaviour in their classroom. The researcher investigated the effects of the teacher research project on teacher efficacy (their feelings of effectiveness), teacher empowerment (their sense of control over their work in the classroom) and collaboration. A range of qualitative and quantitative data were collected at the beginning and end of the programme.**

### Lin; (2002a)

**Cb. Evaluation:** Researcher-manipulated  
**The study is a piece of action research and is hard to categorise. It is stated that "the researcher initiated a three-year research project" this suggests that it is researcher manipulated. There is no control group.**

**Data were collected at intervals throughout the project.**  
**This is a three year action research project initiated by a researcher following an invitation from a school undergoing a school based project about curriculum reform. Data collected are qualitative and obtained through observations and discussions throughout the time period of the intervention from Oct 1998 to Jun 1999. A group of four teachers of first grade mathematics was chosen from a school in which a researcher was already working on consultancy arrangements related to the study i.e. on the state mandated curriculum innovation. The four teachers were involved in an intervention that aimed to help teachers to create and use cases to facilitate teacher development and to assist teachers in implementing the spirit of curriculum standards into classroom practices.**

### Lloyd et al. (2000)

**Cb. Evaluation:** Researcher-manipulated  
**Before and after**  
**This study describes a non-naturally occurring intervention - a programme of extended inservice training in teachers’ understanding of science - and evaluates its effect by assessing participants’ skills and knowledge prior to and after this training. The researcher was actively involved in delivering the training. Science coordinators and a partner teacher from the same school for 15 schools in Barnsley LEA undertook the same training programme to develop process skills and to see how the programme affected knowledge, confidence and skills.**

### McLymont and Costa (1998)

**Cb. Evaluation:** Researcher-manipulated  
**Evaluating a researcher lead implementation of a new professional development project.**  
**Other (please specify)**  
**Before, during and after**  
**Four maths teachers in one school participated in a two-phased seminar series which embodied techniques in Reflective Coaching Discourses and translated then for the teaching and learning of mathematics in everyday classroom situations. This study was designed to explore alternative approaches to teaching and learning of maths at high school level through a fluid approach to professional development utilising cognitive coaching. Phase one consisted of a professional development seminar series held in June. Phase two consisted of a second seminar series in September. Teachers then met once per month for a professional development session. From September to December weekly coaching conferences were also held.**

### Morin F; L; S; Cb. Evaluation: Researcher-  
**During and after (not before):**  
**The purpose of the study was to "explore the effects of professional development**
There is an attempt as part of the research to change people’s experience and as a consequence have control over which groups of people are ‘introduced’ or ‘exposed’ or ‘allocated’ to the experience, policy or practice.

<td>Vaughn et al. (1998)</td>
<td>The study was designed to build upon previous, not wholly successful attempts to research and develop effective approaches to CPD by selecting intervention strategies to fit within demands made by teachers and capable of addressing both the needs of students with learning difficulties and whole classes. Four instructional practices were introduced in turn over the course of the year. Initial professional development on each practice was provided by an expert and two follow up meetings were used to discuss implementation of practice and to provide support and encouragement. In the following year teachers were interviewed and an intervention validity checklist completed to determine the extent to which the instructional practices were maintained. Effects were measured by bringing together a range of data about the teachers, their efforts to implement new approaches and their perceptions about such responses and a related set of research evidence.</td>
